Task List

Installing an analog station media bay module (ASM) .............. 19
To configure the MBM .................................................................................................................. 20

Installing the analog terminal adapter ................................. 23
To connect the ATA2 ..................................................................................................................... 25
To mount the ATA2 on a wall ...................................................................................................... 25
To measure the insertion loss from the CO to the analog device .............................................. 26
To measure the insertion loss from the analog device to the CO.............................................. 27

Using an analog telephone ..................................................... 29
To make external calls ................................................................................................................... 29
To make internal calls .................................................................................................................. 29
To answer calls ................................................................................................................................ 30
To make or answer a second call ................................................................................................. 30
To answer a second call while on another call ............................................................................ 30
To hold a call and make a second call ........................................................................................ 30
To cancel MWI ............................................................................................................................... 31
To reply to internal messages ....................................................................................................... 31
To reply to external messages ....................................................................................................... 31

Registering Nortel 20XX and 11XX IP telephones ................. 61
To access the local configuration menu on an IP telephone ....................................................... 63
To deregister a IP telephone from the IP record ......................................................................... 66

Relocating telephones ............................................................ 69
To enable Set relocation and relocate digital telephones .............................................................. 69
To keep an IP telephone active after it is disconnected .............................................................. 70
To move an IP telephone without changing the DN ..................................................................... 70
To move a Nortel IP telephone and change the DN ................................................................. 70

Chapter 1
Getting started with BCM

Refer to the following topics for general BCM information:

- “About BCM” on page 9
- “BCM key hardware elements”
- “Symbols and conventions used in this guide” on page 12
- “Related publications” on page 13
- “How to get Help” on page 15

About BCM

The BCM system provides private network and telephony management capability to small and medium-sized businesses.

The BCM system:

- integrates voice and data capabilities, VoIP gateway functions, and QoS data-routing features into a single telephony system
- enables you to create and provide telephony applications for use in a business environment

Purpose

The concepts, operations, and tasks described in this guide relate to the installation and of devices used with the BCM system. This guide provides task-based information on how to install devices for use with the BCM.

In brief, the information in this guide explains:

- installation of components
- registration and relocation of telephones and devices

Audience

The BCM 4.0 Telephony Device Installation Guide (N0027146) is directed to installers responsible for installing, and maintaining BCM systems.

To use this guide, you must:

- be an authorized BCM installer/administrator within your organization
- know basic Nortel BCM terminology
- be knowledgeable about telephony and IP networking technology
Acronyms

The following is a list of acronyms used in this guide.

Table 1  Acronyms

BCM key hardware elements

BCM includes the following key elements:

- BCM200 main unit
- BCM400 main unit
- BCM1000 main unit
- BCM expansion unit (compatible with BCM400 main unit)
- BCM400 expansion gateway
- media bay modules (MBM):
  - 4x16
  - ASM8, ASM8+
  - BRIM
  - CTM4, CTM8
  - DDIM
  - DSM16+, DSM32+
  - DTM
  - FEM
  - GASM
  - GATM4, GATM8
BCM features

BCM supports the complete range of IP telephony features offered by existing BCM products.

**Note:** You enable the following features by entering the appropriate keycodes (no additional hardware is required)

BCM applications

BCM supports many applications provided on the existing BCM platforms.

**Note:** You enable the following features by entering the appropriate keycodes (no additional hardware is required)

- Voice Messaging for standard voice mail and auto-attendant features
- Unified Messaging providing integrated voice mail management between voice mail and common e-mail applications
- Fax Suite providing support for attached analog fax devices
- Voice Networking features
- LAN (computer telephony engine) CTE
- VEWAN
- IVR
- IP Music
- Contact Center
Symbols and conventions used in this guide

These symbols are used to highlight critical information for the BCM system:

---

**Caution:** Alerts you to conditions where you can damage the equipment.

---

**Danger:** Alerts you to conditions where you can get an electrical shock.

---

**Warning:** Alerts you to conditions where you can cause the system to fail or work improperly.

---

**Note:** Alerts you to important information.

---

**Tip:** Alerts you to additional information that can help you perform a task.

---

**Security Note:** Indicates a point of system security where a default should be changed, or where the administrator needs to make a decision about the level of security required for the system.

---

**Warning:** Alerts you to ground yourself with an antistatic grounding strap before performing the maintenance procedure.

---

**Warning:** Alerts you to remove the BCM main unit and expansion unit power cords from the ac outlet before performing any maintenance procedure.

---
The following conventions and symbols are used to represent the Business Series Terminal display and dialpad.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Example</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>Word in a special font (shown in the top line of the display)</td>
<td><strong>Pswd:</strong></td>
<td>Command line prompts on display telephones.</td>
</tr>
<tr>
<td>Underlined word in capital letters (shown in the bottom line of a two-line display telephone)</td>
<td><strong>PLAY</strong></td>
<td>Display option. Available on two line display telephones. Press the button directly below the option on the display to proceed.</td>
</tr>
<tr>
<td>Dialpad buttons</td>
<td>#</td>
<td>Buttons you press on the dialpad to select a particular option.</td>
</tr>
</tbody>
</table>

The following text conventions are used in this guide to indicate the information described:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>

How to get Help

This section explains how to get help for Nortel products and services.

Getting Help from the Nortel Web site

The best source of support for Nortel products is the Nortel Support Web site:

http://www.nortel.com/support

This site enables customers to:

- download software and related tools
- download technical documents, release notes, and product bulletins
- sign up for automatic notification of new software and documentation
- search the Support Web site and Nortel Knowledge Base
- open and manage technical support cases

Getting Help over the phone from a Nortel Solutions Center

If you have a Nortel support contract and cannot find the information you require on the Nortel Support Web site, you can get help over the phone from a Nortel Solutions Center.

In North America, call 1-800-4NORTEL (1-800-466-7835).

Outside North America, go to the Web site below and look up the phone number that applies in your region:

http://www.nortel.com/callus

When you speak to the phone agent, you can reference an Express Routing Code (ERC) to more quickly route your call to the appropriate support specialist. To locate the ERC for your product or service, go to:

http://www.nortel.com/erc

Getting Help through a Nortel distributor or reseller

If you purchased a service contract for your Nortel product from a distributor or authorized reseller, you can contact the technical support staff for that distributor or reseller.
Chapter 2
Media Bay Modules

When setting up a BCM network you need to decide which MBMs you require. The following provides information on the capacity of trunk modules, and station modules, used on the BCM network.

Table 1 is a list of the trunk modules, and the number of lines each one provides.

Table 1  MBM trunk requirements

Digital extensions are digital or IP telephones. You do not need to include IP telephones when calculating the number of required DSM MBMs. For a list of telephones that can be used with the BCM system refer to the BCM 4.0 Device Configuration Guide (N0027146).
Also refer to the following wiring charts:

- “ASM8, ASM8+, and GASM wiring chart” on page 73
- “DSM16 and DSM32 wiring charts” on page 75
- “DTM wiring chart” on page 77
- “BRIM wiring chart” on page 79

For information on configuring MBMs, refer to the following guides:

- *BCM 4.0 Device Configuration Guide* (N0060600)
- *BCM200/400 4.0 Installation and Maintenance Guide* (N0060612)
- *BCM 4.0 Networking Configuration Guide* (N0060606)
Chapter 3
Installing an analog station media bay module (ASM)

The analog station media bay modules (ASM8, ASM8+, and GASM) can connect to a maximum of eight analog telecommunication devices. These devices are standard analog telephones, cordless telephones, fax machines, answering machines, or modems. The maximum speed for a modem connection is 28.8 kbit/s.

The ASM8 is available in North America only; the ASM8+ and GASM8 are available in North America, the United Kingdom, Australia, and Poland.

In addition to ASM8 features, the ASM8+ and GASM offer the following features:

- Visual Message Waiting Indicator (VMWI) — LED indicates to the end user that a message is waiting.
- Disconnect supervision (Open Switch Interval [OSI] as per EIA/TIA 464) — indicates to the attached device, in an established communication, that the connected device should release the call (see disconnect supervision note).
- Caller ID — provides the name, phone number, and other information about the caller to the end user at the start of the call.
- Firmware downloading capability — allows the system to upgrade the ASM8+ and GASM firmware at customer sites.
- Enhanced ringing capability — ASM8+ and GASM provide a ringing voltage of 2 REN/65 V rms per port.
- Calling line identification (CLID)
- The GASM8 is designated as an ONS (on-premise station) port.

**Disconnect supervision note:** When disconnect happens from the central office, the ASM8+ provides an open switch interval (OSI) to the off-hook station of 850 ms (TIA/EIA 464 section 5.4.10.2.4; minimum is 600 ms) as a disconnect signal. If the station remains on-hook after the disconnect signal, the ASM8+ disconnects the station equipment from the network without returning a tone to it (TIA/EIA 464 section 5.4.10.2.5[1]). After the station equipment goes on-hook, the ASM8+ station interface is restored to on-hook (idle).

It is important to ensure that the device, application, or interface card connected to an ASM8+ station interface conform to these on-hook and off-hook conditions.

The ASM8, ASM8+, and GASM each have one RJ-21 connector on the faceplate. Figure 26 shows the GASM.
Figure 1  GASM faceplate LEDs and connectors

The ringer equivalency number (REN) per port for ASM8 is 1; the REN for ASM8+ and GASM is 2.

Note: The termination of the analog interface can consist of any combination of devices, subject only to the requirement that the sum of the RENs of all the devices does not exceed the REN of the interface to which the device is connected.

Refer to the following for information on installing and configuring an ASM:

- “Configuring the media bay module” on page 66
- “Wiring the ASM” on page 67
- “Installing analog devices” on page 68

For more detailed information on installing the BCM system and related components, refer to BCM200/400 4.0 Installation and Maintenance Guide (N0060612).

Configuring the media bay module

For information on installing a media bay module (MBM) and setting the dip switches, refer to the BCM200/400 4.0 Installation and Maintenance Guide (N0060612).

To configure the MBM

1. Open Element Manager and connect to your BCM system.
2. Click Configuration > Resources > Telephony Resources. The Telephony Resources panel appears (see Figure 27).
3. In the Modules table, select the location of the MBM that you want to configure.
4. Double-click the Programmed type field to display the drop-down list.
5. Select the type of MBM that you installed in that location.
6. Click Enable.
7. Repeat steps 4 to 7 to enable each MBM in your system.

You can set other parameters for the MBMs depending on the type of MBM you installed.
Wiring the ASM

An experienced installer can wire the ASM for your system using the wiring chart, for more information refer to the “ASM8, ASM8+, and GASM wiring chart” on page 73.

Installing analog devices

After the ASM is correctly wired, you can connect your analog devices.

Documentation describing installation and features of your analog devices is supplied with each piece of equipment.
Chapter 4
Installing the analog terminal adapter

The following provides installation instructions for the analog terminal adapter 2 (ATA2) or ATA. The ATA2 connects a standard analog voice device or data communication device to the BCM system through a digital station module. Examples of analog voice devices are analog telephones and answering machines. Examples of analog data communication devices are modems and fax machines.

The ATA2 is designated as either an on-premise station (ONS) or an off-premise station (OPS) port.

Refer to the following topics for information on installing an ATA2:

- “Configuration overview”
- “Installing the ATA2” on page 24
- “Configuring the ATA2” on page 27

Configuration overview

The following describes environment configurations for connecting analog and data devices to the main unit using an ATA2:

- “Analog telephone”
- “Analog data device” on page 24

Analog telephone

Figure 3 on page 23 shows an installation overview for connecting an analog device through an ATA2 to the main unit.

Figure 3  Analog telephone installation overview
Analog data device

The ATA2 connects a standard analog data device, such as a fax or modem, to the BCM system. Figure 4 shows an installation overview for connecting a data communication device through an ATA2 to the BCM system.

Figure 4  Data communication device installation overview

Installing the ATA2

The following provides information on installing the ATA2:

- “Connecting the ATA2”
- “Mounting the ATA2” on page 25
- “Test insertion loss measurement” on page 26

Connecting the ATA2

After the correct environment has been set up, connect the BCM system and the analog device to the ATA2 and then connect the power (see Figure 5).

Figure 5  ATA2 top view

Figure 6 shows the pin-outs for the connection cables.
To connect the ATA2

1. Connect one end of a line cord to the ATA2 terminal jack.
2. Connect the other end to your telephone, modem, or fax machine.
3. Connect one end of a line cord to the ATA2 line jack.
4. Connect the other end to an available station port on the BCM main unit or expansion unit.
5. For a 120 V or 230 V system, plug the DIN connector of the power supply cord into the power supply connector receptacle. Plug the adapter into a standard AC outlet.

Caution: In North America, the ATA2 must be powered from a Class 2 power source that is UL- and CSA-approved.

In Europe, the ATA2 must be powered from a Class II power source that is CE marked.

Mounting the ATA2

After the ATA2 is correctly connected, you can mount the unit on a wall, as described in this section.

To mount the ATA2 on a wall

1. When using 0.5 mm wire (24 AWG), select a location within 800 m (2600 ft.) of the BCM main unit.
2. Allow 12.5 cm (5 in.) clearance for the line jack, terminal jack, and power supply connector.
3. Screw two 4-mm (#8) screws into the wall, 130 mm (5 1/4 in.) away from each other. Leave 6 mm (1/4 in.) of the two screws showing.
4. Align the slots at the back of the ATA2 unit over the screws. Push the unit against the wall. The line jack, terminal jack, and power supply connector must be at the top of the ATA2 (see Figure 7).
Test insertion loss measurement

The maximum loss for ATA2 to Central Office (CO) configuration must not exceed 10 dB (see Figure 8 on page 26).

To measure the insertion loss from the CO to the analog device

1. Establish a connection to the 1 mW, 1 kHz, CO service line with an analog telephone attached to the ATA2.
2. Ensure that the analog port terminates correctly in 600 ohms:
   - Replace the analog telephone with the test set.
• Use RECEIVE/600 OHM/HOLD mode on the test set.

3 Ensure that the test set connects in parallel to the service line before removing the analog telephone or the line drops.

4 Remove the single-line telephone.

5 Measure the 1 kHz tone at the far end of the analog port, which is where the analog loop ends and where the analog device connects.

---

**Note:** The tone must be greater than -10 dB (for example, -9 dB is acceptable).

---

**To measure the insertion loss from the analog device to the CO**

1 Establish a connection to a silent termination on the CO service line with an analog telephone attached to the ATA2.

2 Make sure the analog port terminates correctly in 600 ohms:
   • Replace the analog telephone with the test set.
   • Use TRANSMIT/600 OHM/HOLD mode on the test set.

3 Make sure the test set connects in parallel to the service line before removing the analog telephone or the line drops.

4 Remove the analog telephone.

5 Introduce a 1 kHz tone into the analog line at -10 dBm, and measure the level at the CO exchange.

---

**Note:** The difference in levels is the transmit loss and must be less than 10 dB (for example, 9 dB is acceptable).

---

**Configuring the ATA2**

Configure the ATA2 using Element Manager or Telset Administration. For detailed configuration information, refer to the *BCM 4.0 Device Configuration Guide* (N0060600).
Chapter 5
Using an analog telephone

The following explains how to make, and answer, calls and how to access features on analog telephones. Features described in this guide are for analog telephones with a LINK or FLASH button.

Note: Analog telephones in Europe or Australia have a RECALL button instead of a LINK or FLASH button.

If your telephone does not have a LINK, FLASH, or RECALL button, you must use the Hook Switch (located under the handset). The Hook Switch must be pressed for approximately one half of one second.

If your telephone does not have a * or # button, you must use dialpad numbers. To indicate a *, enter the number 1. To indicate a #, enter the number 3.

Making and answering calls

Refer to the following procedures to make and answer calls:

- “To make external calls”
- “To make internal calls”
- “To answer calls” on page 30
- “To make or answer a second call” on page 30
- “To answer a second call while on another call” on page 30
- “To hold a call and make a second call” on page 30

To make external calls

1. Lift the handset.
2. Dial the external code (or line pool code) to access an external line.
3. Dial the telephone number.

Contact your system administrator to confirm what external code or line pool code to use on your telephone.

To make internal calls

1. Lift the handset.
2. Dial the extension number.

Contact your system administrator for a list of extension numbers.
To answer calls
Lift the handset to answer a call when your telephone rings.

To make or answer a second call
You can have two calls active at the same time. Use LINK [2] to switch between calls.

To answer a second call while on another call
Press LINK [2] to answer the second call. The first call is automatically placed on hold.

To hold a call and make a second call
Press LINK [2] to place the first call on hold. Dial the telephone number of the second call.

Call Display Information
Depending on the system hardware/software configuration, Call Display information (CLID) for incoming external calls can be viewed on analog display telephones. Your system administrator must enable the CLID feature for your telephone in system programming.

The name and number of an external caller appears on the telephone display after the first ring (second ring if this is an analog line).

Note: Not all analog display telephones are capable of showing name and number information.

Contact your system administrator for more information on Call Display capabilities for your telephone.

Message Waiting Indication (MWI)
Depending on the system hardware/software configuration, visual or audible signalling for Message Waiting Indication (MWI) is available for analog telephones.

There are two MWI types: Stutter Dial Tone and Lamp Indication. Your system administrator determines which MWI type is assigned to your telephone in system programming:

- **Stutter Dial Tone**
  Lift the handset. You hear a stuttered dial tone when you have a message waiting.

- **Lamp Indication**
  The indictor lamp on your telephone lights when you have a message waiting. The lamp indication supported on the GASI ports are low voltage, and do not meet the typical CO voltage requirements.
To cancel MWI

Press LINK # 6 5 or reply (listen) to your new messages. Since MWI is only active when you have a new message, after you have replied (listened) to your message, it is no longer a new message, and MWI is canceled.

Replying to messages

You can receive internal and external messages.

• Internal messages are sent from a designated direct-dial telephone or an internal voice message center on your system.
• External messages are sent from a remote voice message center outside your system.

Contact your system administrator to confirm your mailbox privileges on an internal or remote voice message center.

To reply to internal messages

1 Press LINK # 6 5 to be automatically connected to the internal message sender. If you have more than one message waiting, you are connected to the sender of the first received message.

2 Dial the extension for the internal voice message center. Enter your mailbox number and password and press #. Follow the voice prompts to access your messages. Contact your system administrator for the extension number of the internal voice message center.

3 For more information on internal voice messaging features, refer to “Voice Messaging - Internal” on page 34.

4 Dial the single-digit access code for the designated direct-dial telephone to retrieve your messages. Contact your system administrator for the single-digit access code.

To reply to external messages

Place a call to the remote voice message center to retrieve your messages. Contact your system administrator for the telephone number of the remote voice message center.
Feature list

Table 3 lists available telephone features.

Table 3  Telephone features and descriptions (Sheet 1 of 3)

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
Directs your calls to another telephone connected to your system. Press LINK [4] followed by the extension number of the telephone that is to receive the forwarded calls.                                                                                                                |
| Call Park              | LINK [7] 4  
Parks the call on hold and allows it to be retrieved from any other telephone within the system. When the call park is successful, you hear a confirmation tone, and the call is parked on the highest numbered park code in the system. If call park is unsuccessful, you hear an error tone, and remain connected with the call.  
To retrieve a parked call: Lift the handset, and dial the retrieval code.  
Contact your system administrator for a list of park codes.  
For analog devices, Call Park is activated on the last Call Park port (for example, X25).                                                                                                                                 |
| Call Pickup, directed  | LINK [7] 6 and the extension number of the ringing telephone.  
Allows you to answer any ringing telephone in your system.                                                                                                                                                                                                                       |
| Call Pickup, group     | LINK [7] 5  
Allows you to answer any ringing telephone within your pickup group.                                                                                                                                                                                                                                                                         |
| Call Queuing           | LINK [8] 0 1  
Allows you to answer the next call. If more than one call is waiting, priority is given to incoming external calls over callback, camped, or transferred calls.                                                                                                                                                                           |
| Camp-on                | LINK [8] 2 and the extension number  
Allows you to reroute a call to another telephone even if all the telephones' lines are busy.                                                                                                                                                                                                                           |

| Transferring a call:  
|                  | Make or answer a call.  
|                  | Press **LINK [7 0]**.  
|                  | Dial the extension number of the telephone to receive the transfer call.  
|                  | Replace the handset to complete the transfer.                                                                                                                                                                   |
| Transfer using announce:  
|                  | Make or answer a call.  
|                  | Press **LINK [7 0]**.  
|                  | Dial the extension number of the telephone to which you want to transfer the call.  
|                  | Announce the call to the receiving party.  
|                  | Replace the handset to complete the transfer.                                                                                                                                                                    |
| Transfer using conference:  
|                  | Make or answer a call.  
|                  | Press **LINK [2]**. The call is put on hold temporarily.  
|                  | Make a second call.  
|                  | Press **LINK [3]**  
|                  | Replace the handset to complete the transfer.                                                                                                                                                                    |
| Trunk Answer     | **LINK [8 0 0]**  
|                  | Allows you to pick up a ringing external call on a line placed into a Ringing Service schedule.                                                                                                               |
| Voice Call       | **LINK [6 6]** and the extension number  
|                  | Allows you to make a voice announcement, or begin a conversation, through the speaker on a digital telephone, without making the other telephone ring.                                                      |
| Voice Messaging - Internal | **LINK [9 8 1]** and follow the voice prompts.  
|                  | Allows you to open your mailbox to listen to your messages.                                                                                                                                                |
|                  | **LINK [9 8 0]** and follow the voice prompts  
|                  | Allows you to record and send a message directly to a mailbox, without calling the extension.                                                                                                              |
|                  | **LINK [4]**  
|                  | Allows you to forward calls directly to your mailbox.                                                                                                                                                     |
Other documents

Refer to the *BCM 4.0 Telephone Features User Guide* (N0027160) for a complete list of features available for all types of telephones on your system.

**Note:** You press the FEATURE button on digital telephones to access features. You press LINK *, FLASH *, or RECALL * buttons on analog telephones to access features.
Chapter 6
Telephone button icons

The digital phone Feature button is a small globe icon. The legacy digital phone Feature button reads Feature or Fx. The IP telephones display Feature above the far left display key, when feature selection is available.

The appearance of FEATURE indicates pressing the Feature key before entering a feature code. The table below shows which buttons to use on the different types of Nortel telephones to use the features. Refer to each user card for specific details about each type of telephone.

The following labels are used to indicate each type of configuration button:

- FEATURE indicates pressing the Feature key.
- HOLD indicates pressing the Hold key.
- RLS indicates pressing the Release key.

The following labels are used to indicate each type of configuration button:

- FEATURE indicates pressing the Feature key.
- HOLD indicates pressing the Hold key.
- RLS indicates pressing the Release key.

Note: Your telephone may not have access to all the features listed in this guide, either because your telephone does not support the feature, or because the feature has not been enabled at your telephone. Your system administrator can provide details.
## Telephone features

### Table 4  Telephone features (Sheet 1 of 7)

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Background Music**  | FEATURE 86  
Listen to music (provided by an external source or an IP source connected to the system) through your telephone speaker when you are not on a call.  
Cancel: FEATURE #86 |
| **Button Inquiry**    | FEATURE *0  
Check what is programmed on any button. Use when labeling buttons.                                                                              |
| **Call Duration Timer** | FEATURE 77  
Briefly display the approximate length of your current or most recent call.                                                                          |
| **Call Forward**      | FEATURE 4  
Send your calls to another telephone in your system.                                                                      
Cancel: FEATURE #4 |
| **Call Park**         | FEATURE 74  
Put a call on hold so that it can be picked up from any telephone in your system. The display shows a three-digit retrieval code.  
To retrieve a parked call: press an intercom button and dial the retrieval code. On model 7000, 7100, and 2001 telephones, lift the handset and dial the retrieval code. |
| **Call Pickup, directed** | FEATURE 76  
and the telephone number.  
Answer any ringing telephone.                                                                                                           |
| **Call Pickup, group** | FEATURE 75  
Answer a call that is ringing at another telephone in your pickup group. The external call that has been ringing longest is answered first. |
| **Call Queuing**      | FEATURE 801  
Answer the next call. If more than one call is waiting, priority is given to incoming external calls over callback, camped, or transferred calls. |
| **Camp-on**           | FEATURE 82  
and the extension number of the receiving telephone  
Re-route a call to another telephone even if all lines on that telephone are busy.                                                             |
| **Class of Service Password** | FEATURE 68 plus CoS password  
Change the dialing filters on a line or telephone, or gain external access to your system.  
Dialing filters determine which numbers you can dial.  
The CoS password is provided by your system administrator to change your class of service.                     |
| **Conference**        | FEATURE 3  
Establish a conference call between yourself and two other parties.  
1. Place or answer the first call.  
2. Put the first call on hold.  
3. Place or answer the second call.  
4. After the second call is connected, press FEATURE 3.  
5. Press the line or intercom button of the first held call (not required on model 7000, 7100, or 2001 telephones).  
6. Press RLS to end the conference call. |
To remove yourself from a conference permanently (unsupervised conference):
Press **FEATURE 70**.
The other two callers remain connected. (Some external lines do not support this feature.)

To put a conference on hold:
Press **HOLD**. The other two callers can continue to talk to each other.

To split a conference:
Press the line or intercom button of one caller to consult privately while the other caller is on hold.

To re-establish the conference: Press **FEATURE 3**.

To disconnect one party:
1. Press the line or intercom button for the caller you want to disconnect.
2. Press **RLS**.
3. Press the line or intercom button for the remaining caller to resume your conversation.

To independently hold two calls:
1. Press the line or intercom button of the first caller.
2. Press **HOLD**. The second caller is put on hold automatically.

To re-establish the conference:
1. Retrieve one call from hold.
2. Press **FEATURE 3**.
3. Retrieve the second call from hold.

To send Hookswitch or DTMF during a conference call
Either system telephone engaged in a three-way conference call over a Network CLID or DS trunk can issue a hookswitch or DTMF dialing request without leaving the conference, if the feature is enabled.

**Note:** This feature is not available for IP telephones.
- To hear DTMF tones on both telephones during dial, activate Long Tones (**FEATURE 808**).
- To conference in someone through the trunk, use **Link** (**FEATURE 71**)

---

</thead>
</table>
| **Do Not Disturb**    | FEATURE 85  
When you are not on a call, prevent all incoming calls, except priority calls, from ringing at your telephone. When you are on a call, block an incoming priority call. |
|                       | Cancel: FEATURE #85                                                        |
| **Group Listening**   | FEATURE 802  
Use both the handset and speaker while you are on a call. To avoid electronic feedback, keep the handset away from the speaker during the call, and press RLS to hang up. **Note:** Most of the portable handsets do not have speakers, and cannot use this feature. |
| **Handsfree**         | Handsfree/mute or Handsfree button  
Press the key to transfer a call from the handset/headset to the telephone speaker. If you lift the handset, return it to the cradle. **Note:** Handsfree speaker volume returns to the default volume set at the telephone at the end of each call. |
| **Hold**              | Press HOLD  
Temporarily suspend a call. To retrieve a held call, press the line button for the held call. **(Press HOLD on model 7000, 7100, and 2001 telephones to toggle between two calls.)** |
| **Hold - Exclusive**  | FEATURE 79 or FEATURE/HOLD  
Temporarily suspend a call and prevent other telephones from picking it up. |
| **Hold - Auto**       | FEATURE 73  
Set your telephone to automatically put a call on Hold when you answer a second call, or stop your telephone from doing so. Default is selected (feature is on). **Note:** Telephones which have system-wide call appearance buttons (SWCA) must have this feature active (selected). |
|                       | Cancel: FEATURE #73                                                        |
| **Language choice**   | FEATURE *501: Select Primary Language for the telephone display.  
FEATURE *502: Select Alternate Language for the telephone display.  
FEATURE *503: Select Alternate Language 2 for the telephone display.  
FEATURE *504: Select Alternate Language 3 for the telephone display. |
| **Last Number Redial**| FEATURE 5  
Automatically redial the last external telephone number that you dialed. |
| **Line pools**        | FEATURE 64  
With a line pool, telephones can share several lines for placing calls.  
1. Press FEATURE 64 or an intercom button.  
2. Enter a line pool access code. (See your system administrator for a list.) |
| **Line redirection**  | FEATURE 84  
Send calls arriving on an external line to another telephone outside your system. (Some external lines do not support this feature. See your system administrator.) This feature is not available on model 7000, 7100, or 2001 telephones. |
|                       | Cancel: FEATURE #84                                                        |
| **Link**              | FEATURE 71  
Generate a Link signal to access a PBX or other host exchange. |

<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| Internal and external page | **FEATURE 63** and zone (0 to 6)  
Make a page announcement through both your telephone speakers and an external loudspeaker system. Zone 0 pages all zones. |
| Incoming page during active call: | The system can be set to either:  
• Put an active call on hold, and broadcast the incoming page.  
• Archive the page until you release the call.  
This feature is set by your system administrator.  
**Note:** Business Series Terminals: A call on mute when the page comes in, does not remain muted when it is released from hold after the page. |
| Pause            | **FEATURE 78**  
Program in an external autodial sequence to insert a 1.5-second delay.  
For pulse dialing: * also inserts a 1.5-second delay.  
**Note:** This feature is not supported on ISDN trunks. |
| Priority call    | **FEATURE 69**  
Interrupt a person who is on a call.  
A person on another call can press **FEATURE 85** (Do Not Disturb) to block priority calls. |
| Privacy          | **FEATURE 83**  
Change the privacy setting for an external line. If a line normally has privacy, this permits another telephone that shares the line to join your call by selecting the line while you are using it. If a line normally has privacy disabled, this prevents another telephone that shares the line from joining your call by selecting the line while you are using it. The privacy setting is re-established once you end your call or when you enter the Privacy feature code again. |
| Ring again       | **FEATURE 2**  
Monitor a busy or unanswered telephone, or a busy line pool within your system. Ring Again signals you to call back when the telephone or line pool becomes available.  
**Cancel:** **FEATURE #2** |
| Ring type        | **FEATURE *6**  
Select a distinctive ring to help differentiate between your telephone and others nearby.  
1. Press **FEATURE *6**.  
2. Enter the ring type number (1 to 4).  
3. Press **HOLD**. |
| Ring volume      | **FEATURE *80**  
Make your telephone ring so that you can adjust the volume. You also can adjust the volume any time your telephone rings. |
| Run/stop         | **FEATURE *9**  
Store more than one autodial number or external carrier feature code on one memory button by inserting a break point between numbers or codes. The first press of the button dials the first number or code; the next press dials the next number or code. You can program up to four numbers or codes separated by break points. |
| Saved number redial | **FEATURE 67**  
Save a number to redial later. Enter the code while you are on a call that you have dialed to save the number. Enter the code when you are not on a call to redial the saved number. |

| Service schedules | FEATURE 870  
Display the modes that have been turned on at a designated control set. |
| Ringing services | FEATURE 871  
Cancel: FEATURE #871  
Turn on one of six schedules for alternative ringing/call answering arrangements from a designated control telephone. |
| Restriction services | FEATURE 872  
Cancel: FEATURE #872  
Turn on one of six services for restrictions on particular lines or telephones from a designated control telephone. You are required to enter a password. |
| Routing services | FEATURE 873  
Cancel: FEATURE #873  
Turn on one of six services for routing on particular lines or telephones from a designated control telephone. You must enter a password. |
| Speed dial - using | FEATURE 0  
Dial an external telephone number using a two or three-digit code. There are two types of speed dial codes: system (01-70 or 001 to 255) and personal (71 to 94). System speed dial codes can be used from any display telephone in the system. They are assigned by your system administrator. Personal speed dial codes are used exclusively at your telephone.  
To make a call using a speed dial code:  
1. Press FEATURE 0.  
2. Enter the two- or three-digit code for the number. |
| Speed dial - programming | To program personal speed dial numbers:  
1. Press FEATURE *4.  
2. Enter a two-digit code from 71 to 94.  
3. Specify the external line by pressing a line button, a line pool button, or the intercom button. If you do not specify the external line, the system automatically chooses a line for the call.  
4. Dial the telephone number you want to program (up to 24 digits).  
5. Press HOLD.  
6. Record the code and number you have just programmed.  
Note: You cannot program personal speed dial numbers while someone else is programming your system. |
| Static time and date | FEATURE 806  
Cancel: FEATURE #806  
Change the first line of the display to the current time and date. |
| SWCA keys | FEATURE *521 to FEATURE *536 programmed to buttons with indicators  
If you are part of a call group, you may have a number of line buttons that are labelled as SWCA. How you use these buttons depends on how the System Administrator set up the system. (Refer to the SWCA user card for detailed instructions.)  
FEATURE *520 Find first available SWCA key assigned to this telephone.  
FEATURE *537 Find the oldest parked SWCA call on this telephone.  
FEATURE *538 Find the newest parked SWCA call on this telephone. |
| Time | FEATURE 803  
Briefly display the time and date while you are on a call. |

</tr>
<tr>
<td></td>
<td>Display the name, number, or line name of a ringing or held call. Press # to move through the information displays.</td>
</tr>
</tbody>
</table>
To view your Call Log:
1. Press FEATURE 812.
2. Press * to view old items.
   Press # to view new items.
   Press 0 to return to the last viewed item.
3. Press # and * to move through your items.
4. Press the volume bar to view more information on an item.

To erase a Call Log entry:
1. Press HOLD while viewing an item.

To return a call from your Call Log:
1. Display the desired number on your telephone.
2. Edit the number, if required. You can add numbers for long distance dialing or line pool access or remove numbers using the volume bar.
3. Press a line button.
4. Lift the handset.

Select the type of calls that automatically are stored in your Call Log. Press # to see the next setting. Press HOLD to select the displayed setting.

Program a four-digit password for your Call Log. To reset a forgotten password, see your system administrator.

Store caller information for your current call in your Call Log.

Chapter 7
ISDN

The following provides information about using ISDN lines on your BCM system. Detailed information about ISDN is widely available through the internet. Your service provider can also provide you with specific information to help you understand what suits your requirements.

Refer to the following topics for information:

- “ISDN hardware” on page 49
- “ISDN standards compatibility” on page 51
- “Planning your ISDN network” on page 52
- “Supported ISDN protocols” on page 53

Types of ISDN service

Two types of ISDN services (lines) are available: Basic Rate Interface (BRI) and Primary Rate Interface (PRI). Each line is made up of separate channels known as B and D channels which transmit information simultaneously.

- BRI is known as 2B+D because it consists of two B-channels and one D-channel.
- PRI is known as 23B+D (in North America) or as 30B+D (in Europe). In North America, 23B+D consists of 23 B-channels and one D-channel (T1 carrier). In Europe, 30B+D consists of 30 B-channels and one D-channel (E1 carrier).

B-channels: B-channels are the bearer channel and are used to carry voice or data information and have speeds of 64 kbps. Since each ISDN link (BRI or PRI) has more than one B-channel, a user can perform more than one transmission at the same time, using a single ISDN link.

D-channels: The standard signaling protocol is transmitted over a dedicated data channel called the D-channel. The D-channel carries call setup and feature activation information to the destination and has speeds of 16 kbps (BRI) and 64 kbps PRI. Data information consists of control and signal information and for BRI only, packet-switched data such as credit card verification.

Note: Throughout this section, references are made to Service profile identifiers (SPIDs). SPIDs are a part of the BRI National ISDN standard. SPIDs are not used in the ETSI BRI standard or on PRI.

PRI services and features

The services and features provided over PRI lines include:

- Call-by-call service selection (NI protocol)
- Emergency 911 dialing, internal extension number transmission
- Access to Meridian 1 private networking (SL-1 protocol)
BRI services and features

The services and features provided over BRI lines include:

- data transmission at speeds up to 128 kbps per loop (depending on the bandwidth supported by your service provider)
- shared digital lines for voice and data ISDN terminal equipment

BCM Basic Rate Interface (BRI) also support D-channel packet service between a network and terminal connection. This allows you to add applications such as point-of-sale terminals (POSTA) without additional network connections. Connecting a POSTA allows transaction terminals (devices where you swipe credit or debit cards) to transmit information using the D channel of the BRI line, while the B channels of the BRI line remain available for voice and data calls. A special adapter links transaction equipment, such as cash registers, credit card verification rigs, and point-of-sale terminals, to the X.25 network, which is a data communications network designed to transmit information in the form of small data packets.

To support the D-packet service, your ISDN network and financial institution must be equipped with a D-packet handler. To convert the protocol used by the transaction equipment to the X.25 protocol, your ISDN network must also be equipped with an integrated X.25 PAD which works with the following versions of X.25: Datapac 32011, CCITT, T3POS, ITT and API. The ISDN service package you order must include D-packet service (for example, Package P in the United States; Microlink™ with D-channel in Canada).

Your service provider supplies a Terminal Endpoint Identifier (TEI) and DN to support D-packet service. The TEI is a number between 00 and 63 (in Canada, the default range is 21-63). Your service provider may also supply you with a DN to program your D-packet device. The DN for D-packet service becomes part of the dialing string used by the D-packet to call the packet handler.

Service provider features

BCM supports the following ISDN services and features offered by ISDN service providers:

- D-channel packet service (BRI only) to support devices such as transaction terminals. Transaction terminals are used to swipe credit or debit cards and transmit the information to a financial institution in data packets.
- Calling number identification (appears on both BCM sets and ISDN terminal equipment with the capability to show the information).
- Multi-Line hunt or DN hunting which switches a call to another ISDN line if the line usually used by the Network DN is busy. (BRI only)
- Subaddressing of terminal equipment (TE) on the same BRI loop. However, terminal equipment which supports sub-addressing is not commonly available in North America. (BRI only)

Transmission of B-channel packet data using nailed up trunks is not supported by BCM.

Contact your ISDN service provider for more information about these services and features. For more information about ordering ISDN service in North America, see “Ordering ISDN PRI” on page 52 and “Ordering ISDN BRI” on page 52.
Chapter 7  ISDN

The terminal equipment (TE) connected to the BCM system can use some feature codes supported by the ISDN service provider.

ISDN hardware

To support connections to an ISDN network and ISDN terminal equipment, your BCM must be equipped with a BRI S/T Media Bay Module (BRIM) or a Digital Trunk Media Bay Module (DTM) card configured for PRI.

The following describes the hardware:

- “PRI hardware”
- “BRI hardware”

PRI hardware

The Digital Trunk Media Bay Module (DTM) is configured for PRI. In most PRI network configurations, you need one DTM configured as PRI to act as the primary clock reference. The only time when you may not have a DTM designated as the PRI primary clock reference is in a network where your BCM system is connected back-to-back with another switch using a PRI link. If the other switch is loop-timed to your BCM system, your DTM (PRI) can be designated as a timing master.

If your BCM has more than one DTM configured as PRI, you must assign the first DTM as the primary reference, the second DTM as the secondary reference.

If the system has a BRI module, it should be set as the timing master when a DTM in the same network is defined as the primary reference.

BRI hardware

The loops on the BRI module can be programmed to support either network or terminal connections. This allows you to customize your arrangement of lines, voice terminals, data terminals and other ISDN equipment. This section describes some basic hardware configurations for network and terminal connections for each loop type.

A BRI module provides four loops. Each loop can be individually programmed as:

- an S reference point connection (S loop) to ISDN terminal equipment (TE), or
- a T or S reference point connection (T loop or S loop) to an ISDN network using an external NT1.

S Reference Point

The S reference point connection provides either a point-to-point or point-to-multipoint digital connection between BCM and ISDN terminal equipment (TE) that uses an S interface. Refer to Figure 9.

S loops support up to seven ISDN DNs, which identify TE to the BCM system.
Figure 9  S reference point

T Reference Points

The T reference point connections provide a point-to-point digital connection between the ISDN network and BCM. Refer to Figure 10.

A T loop provides lines that can be shared by all BCM telephones, peripherals and applications, and ISDN TE.

Figure 10  T reference point

A T loop can be used in combination with an S loop to provide D-packet service for a point-of-sale terminal adapter (POSTA) or other D-packet device. D-packet service is a 16 kbps data transmission service that uses the D-channel of an ISDN line. The T and S loops must be on the same physical module.
Chapter 7  ISDN

Clock source for ISDN

Systems with ISDN interfaces need to synchronize clocking with the ISDN network and any ISDN terminal equipment connected to the network. Systems synchronize clocking to the first functionally available network connection. If there are excessive errors on the reference network connection, the next available network connection is used for clock synchronization. The clock synchronization process generates alarm codes and event messages. Clock synchronization is supported by the DTM, BRI module, and FEM.

The BCM derives timing from the network using T reference points (loops). Terminal equipment on S reference points (loops) derive timing from the BCM system.

When you configure the network connections to the BCM, you should take into account the system preferences for selecting loops for synchronization:
- lower numbered loops have preference over higher numbered loops
- the loop preference order is: 201, 202, 203, 204 etc.
- the system skips S and analog loops, when selecting a network connection for synchronization

Systems with only S loops act as timing masters for the attached terminal equipment (TE), and are not synchronized to the network. ISDN TE without access to a network connection (BRI lines) has limited or no functionality.

If your system has both a BRI S/T configured as BRI, and a DTM configured as PRI, it is recommended that you use PRI as the primary clock source. See “PRI hardware” on page 49.

ISDN BRI NT1 equipment

The NT1 (network termination type 1) connects an S interface (four-wire) to a U interface (two-wire). In most cases, it connects loops from a BRI module to the network connection, which uses the U interface.

The NT1 converts and reformats data so it can be transmitted to and from the S or T connection. In addition, it manages the maintenance messages travelling between the network and the NT1, and between the NT1 and the BCM system.

The NT1 from Nortel is packaged two ways:
- a stand alone package which contains one NT1 card (NTBX80XX) and a power supply (NTBX81XX)
- a modular package which contains up to 12 NT1 cards (NTBX83XX) and a power supply (NTBX86AA)

ISDN standards compatibility

In North America, BCM ISDN equipment supports National ISDN standards for basic call and calling line identification services. BCM BRI is compliant with National ISDN-1 and PRI is compliant with National ISDN-2.

BCM does not support EKTS (Electronic Key Telephone System) on PRI.

In Europe, BCM supports ETSI Euro and ETSI QSIG standards, and PRI SL-1 protocol.
Planning your ISDN network

For ISDN BRI service, your service provider supplies service profile identifiers (SPIDs), network directory numbers (Network DNs), terminal endpoint identifiers (TEIs), and other information as required to program your BCM, TE and other ISDN equipment.

BCM does not support any package with EKTS or CACH. EKTS is a package of features provided by the service provider and may include features such as Call Forwarding, Link, Three-Way Calling, and Calling Party Identification.

Ordering ISDN PRI

This section provides information about how to order ISDN PRI service for your BCM.

Ordering ISDN PRI service in Canada

Ordering ISDN PRI service in the Canada/United States from your service provider. Set the BCM equipment to the PRI protocol indicated by your service provider.

Ordering ISDN PRI service outside of Canada and the United States

Outside of Canada and the United States order Euro ISDN PRI and/or BRI service from your service provider. Set the BCM equipment to the Euro ISDN protocol.

Ordering ISDN BRI

The following provides information about how to order ISDN BRI service for your BCM.

Ordering ISDN BRI service in Canada

In Canada, order Microlink™ service, the trade name for standard BRI service. You can order either regular Microlink™ service, which includes the CLID feature, or Centrex Microlink™, which includes access to additional ISDN network features, including Call Forwarding.

When ordering Microlink™ service, it must be ordered with EKTS turned off. If you will be using a point-of-sale terminal adapter (POSTA), ask for D-packet service to be enabled.

Ordering ISDN BRI service in the United States

In the United States, regardless of the CO (Central Office) type, order National ISDN BRI-NI-2 with EKTS (Electronic Key Telephone System) turned off. Use the following packages as a guideline for ordering your National ISDN BRI-NI-2. However, we recommend using packages M or P with the BCM system. Contact your service provider for more information about the capability packages it offers. Bellcore/National ISDN Users Forum (NIUF ISDN packages supported by BCM (for ordering in U.S.).
If you want to transmit both voice and data, and support D-channel packet service, order package P. However, BCM does not support the flexible calling for voice and additional call offering features that are included in package P.

Multi-Line Hunt may be ordered with your package. When a telephone number (the Network DN) in the group of numbers assigned by your service providers is busy, the Multi-Line Hunt feature connects the call to another telephone number in the group. BCM supports the feature only on point-to-point, network connections (T loop). Check with your service provider for more information about Multi-Line Hunt.

Any of the ISDN packages will allow you to use sub-addressing, but your ISDN TE must be equipped to use sub-addressing for the feature to work.

### Ordering ISDN BRI service outside Canada or the United States

Outside of Canada or the United States order Euro ISDN PRI and/or BRI service from your service provider. Set the BCM equipment to the Euro ISDN protocol.

### Supported ISDN protocols

The switch used by your service provider must be running the appropriate protocol software and the correct version of that software to support ISDN PRI and BRI. Each protocol is different and supports different services. Contact your service provider to make sure that your ISDN connection has the protocol you require.
Chapter 8
IP telephony

This section includes an overview of the components that make up the BCM IP telephony and Voice over IP (VoIP) features:

- “IP telephones and VoIP trunks” on page 55
- “Creating the IP telephony network” on page 56

IP telephones and VoIP trunks

This section describes two similar applications for IP telephony on the BCM system: IP telephones and VoIP trunks. These applications can be used separately or together as a network voice/data solution.

Refer to the information under the following headings:

- IP telephones
- VoIP trunks

IP telephones

IP telephones offer the functionality of regular telephones, but do not require a hardwire connection to the BCM. Instead, they must be plugged into an IP network which is connected to the through the integrated interface (LAN card) on the BCM.

Calls made from IP telephones through the BCM can pass over VoIP trunks or across Public Switched Telephone Network (PSTN) lines.

Nortel provides two types of IP telephones. The IP telephones are wired to the IP network using Ethernet, in the case of the i-series IP telephones, or are accessed through your desktop or laptop computer, as in the case of the Nortel i2050 Software Phone.

VoIP trunks

VoIP trunks allow voice signals to travel across IP networks. A gateway within the BCM converts the voice signal into IP packets, which are then transmitted through the IP network to a gateway on the remote system. The device at the other end reassembles the packets into a voice signal. H.323 trunks support private networking between BCMs. H.323 trunks can support connections to a number of different types of equipment, including the Meridian 1 (running IPT), Succession 1000/M, DMS100 switches, and SL100 switches, and trunk applications.
Creating the IP telephony network

The following explains the components of the BCM system and the devices it interoperates with to create a network.

The information under the following headings describes the various components of the system:

- “M1-IPT” on page 58
- “Telephones” on page 58
- “Gatekeepers on the network” on page 58
- “IP network” on page 59
- “Public Switched Telephone Network” on page 59

Figure 11 shows components of a BCM network configuration.

In this example, two BCM systems are connected both through a PSTN connection and through an IP network connection. The IP network connection uses VoIP trunks. If the PSTN connections use dedicated ISDN lines, the two systems have backup private networks to each other. Both BCM systems use VoIP trunks through a common IP network to connect to the Meridian (M1-IPT) system.
Networking with BCM

The BCM is a key building block in creating your communications network. It interoperates with many devices, including the Meridian 1 system and H.323 devices. The BCM system can be connected to devices through multiple IP networks, as well as through the PSTN. Multiple BCM systems also can be linked together on a network of VoIP trunks and/or dedicated physical lines.

The BCM can be connected to a LAN through a the integrated interface LAN card, and to a PSTN through trunk media bay modules, as shown for BCM A in Figure 11. Through these networks, the system accesses other systems and network equipment connected to the network.
M1-IPT

The Meridian 1 Internet Telephony Path (M1-IPT) allows Meridian 1 systems to communicate with the BCM via H.323 trunks. Telephones on the M1, such as Meridian telephone A, can initiate and receive calls with the other telephones on the system across IP networks.

To provide fallback at times when IP traffic cannot pass, you can also connect the Meridian to the BCMs through ISDN PRI SL-1 lines, which provide the same MCDN capability that you can achieve through the H.323 VoIP trunks with MCDN active.

A BCM connected to an M1-IPT using the MCDN protocol can provide access to a central voice mail and call attendant systems, which can streamline multi-office telephony administration.

Telephones

The BCM can communicate using digital telephones (Model 7000, 7100, 7208, 7316, 7316E/7316E+KIMs, 7406 (cordless telephone), Norstar M-series telephones, ISDN telephones, analog telephones, and IP telephones and applications. With this much flexibility, the BCM can provide the type of service you require to be most productive in your business.

While analog and digital telephones cannot be connected to the BCM system with an IP connection, they can make and receive calls to and from other systems through VoIP trunks. Calls received through the VoIP trunks to system telephones are received through the integrated interface (LAN card) or the IP network and are translated within the BCM to voice channels.

The IP telephones connect to the BCM across an IP network through either a LAN or a WAN. From the BCM connection, they can then use standard lines or VoIP trunks to communicate to other telephones on other public or private networks. The BCM also supports SIP, H.323 (version 4) and H.323 third-party devices through this type of connection.

Gatekeepers on the network

A gatekeeper tracks IP addresses of specified devices, and provides routing and (optionally) authorization for making and accepting calls for these devices. A gatekeeper is not required as part of the network to which your BCM system is attached, but gatekeepers can be useful on networks with a large number of devices. Referring to Figure 11, for example: Digital telephone A wants to call IP telephone B, which is attached to BCM B, over a network that is under the control of a gatekeeper. Digital telephone A sends a request to the gatekeeper. The gatekeeper, depending on how it is programmed, provides Digital telephone A with the information it needs to contact BCM B over the network. BCM B then passes the call to IP telephone B.

The BCM does not contain a gatekeeper application. If you want to put a gatekeeper on your network, it must be put on a separate gatekeeper server. The BCM is compatible with CS1000 (CSE1K) gatekeepers.

⚠️ Warning: Meridian 1 IPT does not support the RadVision gatekeeper.
IP network

In the network shown in Figure 11, several LANs and a WAN are shown. When planning your network, be sure to consider all requirements for a data network. Your network administrator should be able to advise you about the network setup and how the BCM fits into the network.

WAN

A Wide Area Network (WAN) is a communications network that covers a wide geographic area, such as state or country. For BCM, a WAN is any IP network connected to a WAN card on the BCM system. This may also be a direct connection to another BCM system.

If you want to deploy IP telephones that will be connected to a LAN outside of the LAN that the BCM is installed on, you must ensure the BCM is able to communicate across the WAN interface at that location.

LAN

A Local Area Network (LAN) is a communications network that serves users within a confined geographical area. For BCM, a LAN is any IP network connected to the integrated interface (a LAN card) on the BCM system. Often, the LAN can include a router that forms a connection to the Internet. A BCM can have up to two LAN connections.

Public Switched Telephone Network

The Public Switched Telephone Network (PSTN) can play an important role in IP telephony communications. In many installations, the PSTN forms a fallback route. If a call across a VoIP trunk does not have adequate voice quality, the call can be routed across PSTN lines instead, either on public lines or on a dedicated ISDN connection between the two systems (private network). The BCM also serves as a gateway to the PSTN for all voice traffic on the system.
Chapter 9
Registering Nortel 20XX and 11XX IP telephones

The Nortel IP telephones must register with the system to be able to use the call features and system features.

Determining the registration process

Registering IP telephones to the system is a two-stage process.

1. Set up the system programming to receive registration under Resources > Telephony Resources > IP Terminal Global Settings tab. ()

   On the Global Settings panel:
   - Select the Enable registration check box.
   - If you want the installers to use a single password to configure and register the telephone, select the Enable global registration password check box, and then enter a numeric password in the Global password field.
   - If you want the system to automatically assign DN records to the telephones, select the Auto-assign DNs check box.

   **Note:** Ensure that you have loaded the appropriate keycodes to activate the Nortel IP telephones on your BCM system.

2. Configure each telephone (“Configuring telephone settings” on page 62).

   How you configure the telephones depends on whether DHCP is active on the system.

   **Security Note:** Turn Enable registration and Auto-assign DNs off when the telephones are registered. Nortel cautions that leaving your IP registration open and unprotected by a password can pose a security risk.
— If DHCP (Distributed Host Control Protocol) service on the system is active or the Customer DHCP server has been configured to hand out the specific system network details, the IP telephone automatically attempts to find the server.

After you register the telephone to the system, as described in “Registering the telephone to the system” on page 62, the telephone assumes the parameters it receives from the system, which are described in “Configuring telephone settings” on page 62.

— If DHCP is not configured to provide system information, or if you are not using DHCP on your network, you must configure your telephone parameters before the telephone can register to the system. In this case, follow the directions in “Configuring telephone settings” on page 62, and then follow any of the prompts that appear, as described in “Registering the telephone to the system” on page 62.

— If an external DHCP server is not present, the DHCP server on the main unit supplies IP configuration information for all IP devices (PCs and IP Phones). It also supplies specific connection information to the IP Phones.

### Registering the telephone to the system

When you first connect the telephone to the IP connection, you receive one of the following:

- If the telephone is not yet registered, and when a password is entered in the Terminal Registration screen, the telephone prompts you for that password.

- If Auto Assign DN is not selected, the telephone prompts you for a DN. Refer to “Configuring telephones: IP telephones” in the BCM 4.0 Device Configuration Guide (N0060600).

- If you are prompted for a password, enter the password and press OK.

- If you are prompted for a DN, enter the DN you want assigned to this telephone and press OK.

When the telephone registers, it downloads the information from the system IP Telephony record to the telephone configuration record. This can include a new firmware download, which occurs automatically. If new firmware downloads, the telephone display indicates the event.

---

**Note:** If the telephone displays a prompt that indicates it cannot find the server, follow the instructions in “Configuring telephone settings” on page 62 to enter the specific network path. “Troubleshooting IP telephones” on page 65 describes other possible prompt messages.

---

### Configuring telephone settings

If you are not automatically registered to the system, you can configure the telephone settings to enable you to access a system on the network. You also must perform these steps if your IP telephone is not connected to the same LAN to which the system is connected.
Chapter 9  Registering Nortel 20XX and 11XX IP telephones

To access the local configuration menu on an IP telephone

1  Restart the telephone by disconnecting the power, then reconnecting the power. After about four seconds, the top light flashes and NORTEL NETWORKS appears on the screen.

2  When the greeting appears, immediately, and quickly, press the four display buttons on the 2000 series (three on the 2033 model), one at a time, from left to right. These buttons are located directly under the display.

   Press the button sequence within 1.5 seconds; otherwise the telephone does not enter configuration mode.

   • If Manual Cfg DHCP (0 no, 1 yes) appears on the screen, you successfully accessed the configuration mode.
   • If any other message appears, disconnect, then reconnect the power, and try to access the configuration mode again.

3  Enter the network parameters, as prompted.
   As each parameter prompt appears, use the keypad to define values.
   Use the * key to enter the period in the IP addresses.
   Press OK to move forward.
   Table 7 describes the values for each display parameter.

<td>&lt;digits between 0 and 255&gt;</td>
<td>Set this to the number of times you want the telephone to retry the connection to the system.</td>
</tr>
</tbody>
</table>
| VLAN                | 0: No VLAN 1: Manual VLAN 2: Automatically discover VLAN using DHCP | Choose 0: NO VLAN if there is no VLAN on the network.  
If you do not have DHCP on the network, or if DHCP is supplied by a remote server, select number 1 and enter the VLAN ID*.  
If you have the system DHCP active on your system, select number 2 if you want DHCP to find the VLAN assignment automatically.  
*VLAN is a network routing feature provided by specific types of switches. To find out if VLAN has been deployed on your system, check with your network administrator. If VLAN is deployed, the system administrator responsible for the switch can provide the VLAN IDs for your system. |
| Cfg XAS?            | 0: No (default) 1: Yes | If you want to enable connection to a Net6 service provider server, choose 1. You are then prompted for an IP address for the server.          |

* **Firewall note:** Ensure that the firewall filters are set up to allow IP traffic into and out of the system.
After you have entered all the configuration information, the telephone attempts to connect to the system. The message Locating Server appears on the display. If the connection is successful, the message changes to Connecting to Server after about 15 seconds. Initialization can take several minutes. Do not disturb the telephone during this time.

When the telephone connects to the server and is ready to use, the display shows the time and date. As well, the six keys at the top of the display are labelled.

If you experience problems with IP telephone registration, refer to the section: “Troubleshooting IP telephones” on page 65.

Notes:

- If the DN record is not configured yet, as is the case with auto-assigned DNs, you can only place local calls until other lines are assigned in the DN record.
- If the telephone has not been registered before, you receive a New Set message. Enter the information, as prompted. Refer to “Registering the telephone to the system” on page 62.

**Troubleshooting IP telephones**

If the system is not properly configured, several messages can appear.

**Table 8** IP telephony display messages

<table>
<thead>
<tr>
<th>Message</th>
<th>Description/Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVER: NO PORTS LEFT</td>
<td>The system has run out of ports. This message remains on the display until a port becomes available and the telephone is powered down and then up. To obtain more ports, you can install additional VoIP keycodes.</td>
</tr>
<tr>
<td>Invalid Server Address</td>
<td>The S1 is incorrectly configured with the IP address of a system network adapter other than the published IP address.</td>
</tr>
<tr>
<td>IP Address conflict</td>
<td>The telephone detected that a device on the network is currently using the IP address allocated to the telephone.</td>
</tr>
<tr>
<td>Registration Disabled</td>
<td>The Registration on the system is set to OFF.</td>
</tr>
<tr>
<td>SERVER UNREACHABLE. RESTARTING . . .</td>
<td>Check that you have entered the correct Netmask and gateway IP addresses. If the settings are correct, contact your system administrator.</td>
</tr>
<tr>
<td>NEW SET</td>
<td>The telephone has not been connected to the system before, and must be registered.</td>
</tr>
</tbody>
</table>

**Programming note**: To display the configuration information for a telephone connected to the system:

- If the telephone is engaged, press the [Key] key, followed by the [Key] key.
**Operation issues**

Table 9 provides solutions to potential problems.

### Table 9  IP telephone troubleshooting

<thead>
<tr>
<th>Problem</th>
<th>Suggested solution or cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>Telephone does not connect to system</td>
<td>If an IP telephone does not display the text <em>Connecting to server</em> within two minutes after power up, the telephone did not establish communications with the system. Double-check the IP configuration of the telephone and the IP connectivity to the system (cables, hubs, and so on).</td>
</tr>
<tr>
<td>Slow connection between the handset and the system</td>
<td>If the connection between the IP client and the system is slow (ISDN, dialup modem), change the preferred CODEC for the telephone from G.711 to G.729. See Table 7.</td>
</tr>
<tr>
<td>One-way or no speech paths</td>
<td>Signaling between the IP telephones and the system uses the system port 7000. However, voice packets are exchanged using the default RTP ports 28000 through 28255 at the BCM, and ports 51000 through 51200 at the IP telephones. If these ports are blocked by the firewall or NAT, you will experience one-way or no-way speech paths.</td>
</tr>
<tr>
<td>Change the contrast level</td>
<td>When an IP telephone is connected for the first time, the contrast level is set to the default setting of 1. Use FEATURE <em>7</em> and the UP or DOWN key to adjust the contrast.</td>
</tr>
<tr>
<td>Block individual IP sets from dialing outside the system</td>
<td>If you want to block one or more IP telephones from calling outside the system, use Restriction filters, and assign them to the telephones you want to block. Restriction filters are set up under <em>Telephony &gt; Call Security &gt; Restriction Filters.</em></td>
</tr>
</tbody>
</table>

**Deregistering IP telephones**

You can deregister selected IP telephones from the system, and force the telephone to go through the registration process again.

---

**Warning:** After this feature is activated, all active calls are dropped.

**To deregister a IP telephone from the IP record**

1. You can access the deregister button from two locations:
   - Configuration > Resources > Telephony Resources > IP Terminal Details tab
   - Telephony > Sets > Active Sets > IP Terminal Details tab
2. From the top list, select the IP telephone that you want to deregister.
3. Click Deregister DN.
4. Reregister the telephone, as described in “Determining the registration process” on page 61.

---

**Warning:** After this feature is activated, all active calls are dropped.
Next step

See IP-specific features: “Global VoIP features” in the BCM 4.0 Device Configuration Guide (N0060600).

See Nortel IP telephones user cards.
Chapter 10
Relocating telephones

The following explains how you can physically move a telephone within the system so that the telephone programming follows the telephone to the new location.

- “Moving digital telephones” on page 69
- “Moving IP telephones” on page 70
- “User card list” on page 71 provides a list of the user cards that provide information about using individual types of telephones, and the features they can access.

Moving digital telephones

To move a digital telephone to a new location within the system so that the programmed settings are retained, set relocation (automatic telephone relocation) must be enabled in system programming. Set relocation saves the internal numbers, autodial settings, and personal speed dial codes within the telephone when the telephone is unplugged.

Note: The set relocation feature applies to the digital telephones and analog telephones, only. IP telephones always retain their programming. Refer to “Moving IP telephones” on page 70.

Tips (if set relocation is enabled)

Relocate existing telephones before new telephones are installed on the jacks. This allows the moved telephones to retain their programming.

Plugging a new telephone into a jack from which another telephone was removed, before the original telephone is reconnected to another jack, results in the programming transferring to the new telephone. In this case, when the original telephone is plugged into another jack, it receives default programming, or the programming specifically entered for the DN record that corresponds to the new jack.

When changing a telephone internal number (DN record), wait one minute for automatic telephone relocation to complete its cycle. When you relocate a telephone, the telephone must remain installed and connected in the new location for at least three minutes for the programming relocation to be complete. Moving the telephone again before the three-minute period is up can result in loss of programming.

To enable Set relocation and relocate digital telephones

1 In the Element Manager, click the keys located beside Configuration > Telephony > Global Settings > Feature Settings.

2 Select the Set relocation check box.
3 **Move the telephone:** Unplug the telephone, and plug it in again at another location. It can take up to 45 seconds for the system to recognize the telephone.

- Clear the **Set relocation** check box after you complete all required moves.

**Keeping an IP telephone active**

In some circumstances, you may want to have your IP telephone stay active after it is physically disconnected. For example, when your i2050 software phone is turned off, you may still want callers to go to your voicemail. To keep your IP telephone active and retain DN-specific features, activate the **Keep DN alive** feature.

**To keep an IP telephone active after it is disconnected**

1. In the Element Manager, go to **Configuration > Telephony > Sets > Active Sets.**
2. Click the **Capabilities and Preferences** tab, and IP Terminal details.
3. Select the **Keep DN alive** check box.

**Note:** Clearing the check box allows the DN record to become inactive if the IP telephone is disconnected.

**Moving IP telephones**

IP telephones retain their DN when they are moved to a new location on the same subnet. The following instructions apply to Nortel IP telephones.

**To move an IP telephone without changing the DN**

1. Disconnect the power from the IP telephone or 3-port switch.
2. Disconnect the network connection.
3. At the new location, reconnect the network cable and the power connection.
4. If the new location is on a different subnet, you must make the appropriate changes to the telephone IP addressing. However, do not change the S1 IP address or the S2 IP address. Disconnect the power from the IP telephone or 3-port switch.

**Note:** If your network is using partial DHCP, reconfiguration is not required at this step.

**To move a Nortel IP telephone and change the DN**

1. Deregister the DN.
2. Disconnect the network connection and the power connection from the telephone.
3 Reinstall the telephone at the new location, and reconfigure the telephone.

**User card list**

The following is a list of feature and device user guides that can be found on your system CD:

- *IP Phone 2001 User Guide* (N0027313)
- *IP Phone 2002 User Guide* (N0027300)
- *IP Phone 2004 User Guide* (N0027284)
- *IP Phone 2007 User Guide* (N0064498)
- *IP Phone 1120E User Guide* (NN-10300-062)
- *IP Phone 1140E User Guide* (NN-10300-064)
- *IP Audio Conference Phone 2033 User Guide* (N0060623)
- *i2050 Software Phone Installation Guide* has on-line user help
- *BCM 4.0 Telephone Features User Guide* (N0060608)
Appendix A
ASM8, ASM8+, and GASM wiring chart

Analog telephony devices, such as single-line telephones, modems, and fax machines, are connected to the analog station module (ASM) through the RJ-21 connector on the front of the media bay module (MBM) (see Figure 12).

Figure 12  ASM RJ-21 connector

Table 10 lists the wiring details for the RJ-21 connector on the ASM.

DTM wiring chart

The digital telephone line is connected to the digital trunk module (DTM) through the RJ-48C jack on the front of the media bay module (MBM) (see Figure 14).

Figure 14  DTM RJ-48C port

Table 12 and Table 13 list the wiring details for the RJ-48C port.

Appendix D  
BRIM wiring chart

The digital BRI ISDN lines are connected to the BRIM through the RJ-45 jacks on the front of the media bay module (MBM) (see Figure 15). You can connect up to four BRI ISDN lines to the BRIM.

Figure 15, Table 14, and Table 15 apply to S-Loop and T-Loop connections. S-Loop connections are used to connect S-Loop devices, such as video phones, terminal adapters, and group 3 fax machines. The T-Loop connections are used to connect to the CO/PSTN.

**Warning:** For a U-Loop connection, the BRIM must be connected only to an NT1 provided by the service provider. The NT1 must provide a Telecommunication Network Voltage (TNV) to Safety Extra Low Voltage (SELV) barrier.

Table 14 and Table 15 list the wiring details for the RJ-45 ports.
