To reset CallPilot message store for Microsoft Outlook 2000 ................................. 85
Chapter 1
Getting started

About this guide
The BCM 4.0 Unified Messaging Configuration Guide describes how to install, configure, and troubleshoot Unified Messaging on a Business Communications Manager (BCM) system and on subscribers’ computers.

You can install CallPilot Unified Messaging on subscribers’ computers, or subscribers can perform some configuration and troubleshooting tasks under your guidance.

About CallPilot Unified Messaging
CallPilot Unified Messaging is a multimedia messaging application. Unified Messaging works with e-mail clients to provide a single graphical interface for e-mail messages and CallPilot voice, fax and text messages.

Hardware requirements
The following list contains both the minimum and recommended hardware that Unified Messaging software needs for operation.

- IBM PC or compatible:
  - minimum Pentium/586 or faster system with 16 megabytes (MB) of RAM minimum; 32 MB recommended
- Monitor:
  - 16-color VGA 640 x 480 capability minimum; 256-color SVGA 800 x 600 capability recommended
- Disk drive space:
  - To install Unified Messaging, subscribers need 110 MB of disk space. After the installation is complete, the temporary files are automatically deleted to recover 55 MB of disk space. You or the subscriber must manually delete the CallPilotDesktopMessaging.exe file to recover the additional 55 MB. The.exe file is located where you downloaded it.
- CD-ROM drive
- Windows-compatible mouse and keyboard
- LAN connection to Business Communications Manager. Subscribers can access their CallPilot messages over the LAN through ISDN, ADSL, dial-up modem or Ethernet.

Note: When it is installed, Unified Messaging takes up 15MB of space on the subscriber’s hard disk.
Optional hardware

- a sound card and a set of speakers for playing messages on a computer
- a microphone for recording messages on a computer

Note: The maximum number of Unified Messaging clients supported on Business Communications Manager is 200. You must have at least 512 MB of RAM on the Business Communications Manager.

Software requirements

Windows operating systems
You can use Unified Messaging with:

- Windows 98 SE
- Windows 2000 Professional
- Windows XP

Unified Messaging also supports Citrix Mainframe XP Feature Release 3 and Citrix Program Neighborhood Version 7.0

Supported Integrated clients

Integrated clients, also called groupware, is software designed for group collaboration. Integrated clients run with a corporate e-mail server. Unified Messaging for integrated clients provides access to commands and Unified Messaging Help directly from the client. During installation, Unified Messaging customizes integrated clients to make messaging tasks simpler and more efficient. Unified Messaging automatically performs most or all of the groupware configuration during installation.

You can use Unified Messaging with one or more of these clients:

- Microsoft Outlook 2000
- Microsoft Outlook 2002/XP
- Microsoft Outlook 2003
- Novell GroupWise 6.x
- Lotus Notes 5.x, 6.x

Supported Internet mail clients

Internet mail clients are also called IMAP clients. It is an e-mail client that enables you to manage CallPilot messages from a folder in the e-mail client using the IMAP protocol. You must manually configure the Internet mail client with the settings required to connect to your system.

You can use Unified Messaging with these IMAP Internet clients:

- Microsoft Outlook Express 5.x and 6.x
• Microsoft Outlook 2000, Outlook 2002 (XP) and Outlook 2003 in Internet mail mode
• Netscape Messenger 6.2x
• Netscape Mail 7.0
• Qualcomm Eudora Pro 6.1.2

Format for voice messages
Business Communications Manager uses the G711 format to record and store voice messages. CallPilot 150 uses G723.1. Since the Unified Messaging player records and plays messages in WAV format, Business Communications Manager or CallPilot messages must be converted to WAV before playing, and composed messages must be converted to G711 or G723.1 to be stored on Business Communications Manager or CallPilot 150. This decoding and encoding is done on the desktop client.

Audience
This guide is for system administrators who configure and maintain CallPilot and Unified Messaging on a BCM system.

Acronyms
The following is a list of acronyms used in this guide.

<table>
<thead>
<tr>
<th>Acronym</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BCM</td>
<td>Business Communications Manager</td>
</tr>
<tr>
<td>CLID</td>
<td>Calling Line Identification</td>
</tr>
<tr>
<td>DN</td>
<td>Directory Number</td>
</tr>
<tr>
<td>DNS</td>
<td>Domain Name System</td>
</tr>
<tr>
<td>IMAP</td>
<td>Internet Message Access Protocol</td>
</tr>
<tr>
<td>ISDN</td>
<td>Integrated Services Digital Network</td>
</tr>
<tr>
<td>LAN</td>
<td>Local Area Network</td>
</tr>
<tr>
<td>LDAP</td>
<td>Lightweight Directory Access Protocol</td>
</tr>
<tr>
<td>SMTP</td>
<td>Simple Mail Transfer Protocol</td>
</tr>
<tr>
<td>VPIM</td>
<td>Voice Profile for Internet Mail</td>
</tr>
</tbody>
</table>
Symbols and text conventions

These symbols are used to highlight critical information for the BCM system:

---

**Caution:** Alerts you to conditions where you can damage the equipment.

---

**Danger:** Alerts you to conditions where you can get an electrical shock.

---

**Warning:** Alerts you to conditions where you can cause the system to fail or work improperly.

---

**Note:** A Note alerts you to important information.

---

**Tip:** Alerts you to additional information that can help you perform a task.

---

**Security note:** Indicates a point of system security where a default should be changed, or where the administrator needs to make a decision about the level of security required for the system.

---

**Warning:** Alerts you to ground yourself with an antistatic grounding strap before performing the maintenance procedure.

---

**Warning:** Alerts you to remove the BCM main unit and expansion unit power cords from the ac outlet before performing any maintenance procedure.
These conventions and symbols are used to represent the Business Series Terminal display and dialpad.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Example</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>Word in a special font (shown in the top line of the display)</td>
<td>\texttt{Pswd:}</td>
<td>Command line prompts on display telephones.</td>
</tr>
<tr>
<td>Underlined word in capital letters (shown in the bottom line of a two line display telephone)</td>
<td>PLAY</td>
<td>Display option. Available on two-line display telephones. Press the button directly below the option on the display to proceed.</td>
</tr>
<tr>
<td>Dialpad buttons</td>
<td>#</td>
<td>Buttons you press on the dialpad to select a particular option.</td>
</tr>
</tbody>
</table>

These text conventions are used in this guide to indicate the information described.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bold Courier text</strong></td>
<td>Indicates command names and options and text that you need to enter. Example: Use the \texttt{info} command. Example: Enter \texttt{show ip {alerts</td>
</tr>
<tr>
<td><em>italic text</em></td>
<td>Indicates book titles</td>
</tr>
<tr>
<td>plain Courier text</td>
<td>Indicates command syntax and system output (for example, prompts and system messages). Example: Set Trap Monitor Filters</td>
</tr>
<tr>
<td><strong>FEATURE HOLD RELEASE</strong></td>
<td>Indicates that you press the button with the coordinating icon on whichever set you are using.</td>
</tr>
</tbody>
</table>

How to get Help

This section explains how to get help for Nortel products and services.

Getting Help from the Nortel Web site

The best way to get technical support for Nortel products is from the Nortel Technical Support Web site:

http://www.nortel.com/support

This site provides quick access to software, documentation, bulletins, and tools to address issues with Nortel products. More specifically, the site enables you to:

- download software, documentation, and product bulletins
- search the Technical Support Web site and the Nortel Knowledge Base for answers to technical issues
- sign up for automatic notification of new software and documentation for Nortel equipment
- open and manage technical support cases

Getting Help over the phone from a Nortel Solutions Center

If you don’t find the information you require on the Nortel Technical Support Web site, and have a Nortel support contract, you can also get help over the phone from a Nortel Solutions Center.

In North America, call 1-800-4NORTEL (1-800-466-7835).

Outside North America, go to the following Web site to obtain the phone number for your region:

http://www.nortel.com/callus

Getting Help from a specialist by using an Express Routing Code

To access some Nortel Technical Solutions Centers, you can use an Express Routing Code (ERC) to quickly route your call to a specialist in your Nortel product or service. To locate the ERC for your product or service, go to:

http://www.nortel.com/erc

Getting Help through a Nortel distributor or reseller

If you purchased a service contract for your Nortel product from a distributor or authorized reseller, contact the technical support staff for that distributor or reseller.
Chapter 2
Configuring your system for Unified Messaging

Before you install Unified Messaging

Before using Unified Messaging:

- In Element Manager, enable the Unified Messaging keycode and the (optional) Fax keycode. For information on enabling software keycodes, refer to the Keycode Installation Guide.
- In CallPilot Manager, ensure that the number of maximum outcalling channels is enough to accommodate the expected CallPilot telephone player usage. This value governs the number of simultaneous channels used for outcalling. For information on setting the outcalling channels, refer to the CallPilot Manager Set Up and Operation Guide.

Unified Messaging and data network security

Due to the complexity and diversity of network configurations, this guide does not cover data network security issues. Discuss security issues with a security specialist or data network administrator.

Configuring IMAP/LDAP/SMTP servers for Unified Messaging

CallPilot supports IMAP/LDAP protocols, which let Unified Messaging subscribers access their CallPilot mailboxes using Microsoft Outlook, Lotus Notes, Novell GroupWise, and selected third-party Internet mail clients: Microsoft Outlook Express, Microsoft Outlook, Netscape Messenger, and Qualcomm Eudora Pro.

Each type of desktop client is configured and used slightly differently. To configure a specific desktop client, refer to “Installing and configuring Unified Messaging” on page 19.

Although you individually configure each desktop client you use for Unified Messaging, you configure Business Communications Manager the same way for all the desktop clients it supports. Follow the instructions in this chapter to configure the IMAP/LDAP/SMTP servers.

IMAP

Internet Message Access Protocol (IMAP) lets a client access and use electronic mail messages on a server. These messages are always stored on Business Communications Manager.
IMAP lets subscribers check for messages from any location with an Internet connection. IMAP also lets subscribers access messages from multiple locations. IMAP is a method of accessing electronic mail or bulletin board messages that are kept on a shared mail server. IMAP lets a client e-mail program access remote message stores as if they were local. For example, e-mail stored on an IMAP server can be accessed from a computer at home, a workstation at the office, and a notebook computer while traveling, without the need to transfer messages or files between these computers.

**LDAP**
Lightweight Directory Access Protocol (LDAP) is a set of protocols for accessing information directories. LDAP supports TCP/IP, which is necessary for any type of Internet access. LDAP lets a client search for and use information entries on a directory server, such as the Business Communications Manager. For example, a typical entry in the CallPilot directory contains attributes of a subscriber such as name, telephone number, and CallPilot mail address. Internet clients can use LDAP to query address book information from the CallPilot directory, perform address resolution, or search for specific subscribers (if this functionality is implemented by the Internet client).

---

**Note:** Unified Messaging clients require LDAP authentication of the CallPilot mailbox directory number and password to begin a search on a Business Communications Manager LDAP directory.

---

**SMTP**
Simple Mail Transfer Protocol (SMTP) is a protocol for sending e-mail messages between servers. Most e-mail systems that send mail over the Internet use SMTP to send messages from one server to another. These messages can then be retrieved with an e-mail client using IMAP. SMTP is also generally used to send messages from a mail client to a mail server. This is why you must specify both the IMAP server and the SMTP server when you configure your e-mail application.

Since Voice Profile for Internet Mail (VPIM) Networking also uses SMTP, you do much of the configuration for IMAP in the same places you set up VPIM Networking.

**Configuring environments without a DNS**
The Domain Name System (DNS) is an Internet service that translates domain names into IP addresses. Because domain names are alphabetic, they are easier for subscribers to remember. The Internet is based on IP addresses. Every time you use a domain name, therefore, a DNS must translate the name into the corresponding IP address. For example, the domain name www.example.com can translate to 198.105.232.4.

If one DNS server does not know how to translate a particular domain name, it asks another one, and so on, until the correct IP address is returned.

Unified Messaging uses Domain Name resolution, which is provided by a DNS. If your network does not have a DNS, then you must configure Unified Messaging to use IP addresses.
For Internet Mail clients, the format for addressing a message is `<SMTP/VPIM prefix><Mailbox number>@<BCM HOST name>.localdomain.`

### Configuring Unified Messaging with IP address only

If you do not use DNS to resolve domain names, configure the Business Communications Manager system and client computers to use an IP address only:

1. Ensure the Business Communications Manager is not configured to use DNS.
2. Ensure that Business Communications Manager is configured with a host name. If it is not, enter the host name on the Business Communications Manager system.
3. Configure computers running Unified Messaging with the IP address of the Business Communications Manager system.

### To check that Business Communications Manager is not configured to use DNS

**Note:** Before you check that the Business Communications Manager is not configured to use DNS, ensure the Business Communications Manager is using a static IP address and DHCP is disabled.

1. Start Element Manager.
2. On the Configuration tab, choose the Data Services folder. The system tasks appear.
3. Choose the DNS task. The Domain Name Service tab appears.
4. Ensure the Enable DNS box is not selected.
5. Ensure the Primary (& Sec.) Server IP Addr field is empty. If it is not, delete any entries.

### To check that a Host Name is entered on the Business Communications Manager

1. Start Element Manager.
2. On the Configuration tab, choose the System folder. The system tasks appear.
3. Choose the Identification task. The System Identification tab appears.
4. Enter a system name in the System Name box, if one is not entered. A system name can be any name (for example, myCompany).
To configure access to the Business Communications Manager on a subscriber computer

On each subscriber computer:

1. Start Unified Messaging for the first time on the client computer. The Unified Messaging Logon page appears.

2. In the Server box, type the IP address.

3. In the Password and Mailbox boxes, enter the subscriber’s password and mailbox number. The e-mail client opens.
Chapter 3
Installing and configuring Unified Messaging

It takes approximately 10 minutes to install Unified Messaging. Depending on the subscribers’ expertise, you can ask them to install Unified Messaging on their computer.

Installation information

Before you install Unified Messaging on a subscriber’s computer:

• Make sure the subscriber’s computer has the correct hardware and software requirements. Refer to “Hardware requirements” on page 9 and “Software requirements” on page 10.

• If the subscriber has any version of Unified Messaging other than 2.5, you must uninstall the earlier version before you do the installation procedure. Refer to “Uninstalling an earlier version of Unified Messaging” on page 20.

• Ensure that the microphones, speakers, and sound cards that are connected to the subscriber’s computer are configured. Refer to the manufacturer’s documentation.

• If the subscriber is going to install Unified Messaging and wants to install the Fax Printer Driver, the subscriber must have the right to impersonate a client after authentication. Refer to the online Microsoft Knowledge Base article Q821546 for more information.

• Have this information available:
  — the fully qualified domain name (FQDN) of the Business Communications Manager system, or the IP address, if you do not have a DNS
  — the SMTP/VPIM prefix of the Business Communications Manager. If you use Message Networking, include this prefix
  — the subscriber’s mailbox number

Note: If the subscriber uses Novell GroupWise, the subscriber must have Windows Messaging 4.0 installed on their computer. Windows Messaging is usually installed when Windows is installed on a computer. However, if Windows Messaging 4.0 is not installed, the GroupWise installation gives you these options:

• Install the complete Windows Messaging system.
• Leave Windows Messaging as is.

Install the Complete Windows Messaging system even if Windows Messaging is already installed. This ensures that the GroupWise option is available during Unified Messaging installation.
Fax feature requirements

There are three new fax features added to CallPilot 2.5 Unified Messaging:

- Fax Mail Merge
- Custom Fax Cover Sheets
- Integrated Fax Messaging Controls

The CallPilot Fax Mail Merge feature allows you to customize and send fax messages to multiple recipients using Microsoft Word’s Mail Merge utility.

When you use the Fax Mail Merge feature, you do not receive a delivery receipt to confirm the recipients received the fax.

You do receive a failure notification, if any or all of the recipients do not receive the fax.

---

Note: You must select the Install Fax batch driver for mail merge option during the installation of Unified Messaging to use the Fax Mail Merge feature.

---

The Custom Fax Cover Sheets allow you to customize your fax cover sheets from the CallPilot desktop client. You can use any digital image as the basis for the cover sheet and customize it for each fax by providing sender information and a cover sheet memo. This information is automatically merged with your cover sheet image when you fax the document.

---

Note: You can download the Custom Fax Cover Sheets from the Administrator Applications Unified Messaging page on the Business Communications Manager web page.

---

Integrated Fax Messaging Controls allow you to create CallPilot messages, attach documents, and view, annotate, and modify fax documents through the CallPilot custom form. This feature is available only to the Windows Groupware clients: Microsoft Outlook, Lotus Notes, and Novell GroupWise.

Uninstalling an earlier version of Unified Messaging

If the subscriber has any version of Unified Messaging other than 2.5 on their computer, uninstall it before you do the installation procedure.

To uninstall Unified Messaging

1. Quit any open applications, including the CallPilot installation program. If you use Microsoft Outlook, it can take an additional minute or two for the mail services to shut down.
2. Click the Windows **Start** button.
3. Click **Control panel**. The **Control Panel** window opens.
4 Click **Add/Remove Programs** icon.
   The Add/Remove Programs properties dialog box appears.

5 In the list, select **Nortel Unified Messaging** and click the **Remove** button.
   The dialog window opens to confirm the deletion.

6 Click **OK**.

### Installing Unified Messaging

You install Unified Messaging from the Business Communications Manager web page.

#### To install Unified Messaging

1 Exit any Windows programs that are running.
2 Start a browser session and connect to the Business Communications Manager web page.
   The Business Communications Manager Login dialog box appears.
3 Enter your user name and password and click the **OK** button.
   The **Welcome to Business Communications Manager** page appears.
4 Click the **User Applications** link.
   The **User Applications** page appears.
5 Click the **Unified Messaging** link.
   The Unified Messaging download page appears. There are two Download Unified Messaging
   links. One link supports English, French, simplified Chinese, and Dutch. The other link
   supports Italian, Japanese, Spanish, and German.
   You can also install the Custom Fax Cover Sheets from this page if you have enabled the fax
   capabilities on your Business Communications Manager.
6 Click the **Download Unified Messaging** link that supports your language.
   The File Download dialog box appears.
7 Click the **Save** button and save the application to where you want to install it.
8 After the application downloads, double-click it to launch the installation, and follow the
   instructions in the installation wizard.
The setup program starts and the Welcome window appears.

![Welcome window](image)

9 Click the **Next** button.

The **Language** screen appears.

![Language screen](image)
11. From the **Language** list box, select the language you want to use and click the **Next** button. The **Destination Folder** screen appears.

12. Click the **Next** button to accept the default directory, or click the **Browse** button if you want to locate other destination folders, and select the folder in which you want to install Unified Messaging.

Nortel recommends that you install Unified Messaging in the default folder. The **E-mail client** screen appears.

13. Select the check boxes for the e-mail clients that you use.

Internet Mail clients include Microsoft Outlook Express, Microsoft Outlook in Internet mail mode, Netscape Messenger, and Qualcomm Eudora Pro.
14 Click the **Next** button. The **CallPilot Server Settings** screen appears.

In the **Server name or TCP/IP address** box, type the FQDN or IP address of the Business Communications Manager system.

16 In the **Server SMTP/VPIM prefix** box, type the SMTP/VPIM prefix of the CallPilot subscriber’s address. If CallPilot Networking is not enabled on the Business Communications Manager system, leave this box blank, otherwise use the value defined in the Local Prefix field in the Digital Networking Properties page in CallPilot Manager.

17 Click the **Next** button. The **CallPilot Mailbox Number** screen appears.

18 Enter the subscriber’s mailbox number. The mailbox number is usually the subscriber’s extension number.
19 Click the Next button. The LDAP Server Settings screen appears.

20 In the LDAP server or TCP/IP address box, verify that the LDAP Server name or IP Address is that of your system. Ensure the Anonymous logon check box is not selected. Do not change the information in the address book search base.

21 Click the Next button. The Ready to Install window appears.

22 If you want to install the fax printer driver, select the Install Fax Printer Driver box. This driver lets you to save a document as a TIFF-F. You can send a TIFF-F as a fax to other CallPilot subscribers.

If you want to install the fax batch driver, select the Install Fax Batch Driver for Mail Merge.
box. This driver lets you customize and send fax messages to multiple recipients using Microsoft Word Mail Merge utility.

If any of these options appear dimmed, they are not supported by Unified Messaging for the type of e-mail client you have chosen, and the appropriate fax drivers are pre-selected.

23 If you want to add Unified Messaging to be added to the default profile used by Outlook, select the Update default mail profile check box.

If you are installing Unified Messaging for Lotus Notes, you must enter your Lotus Notes password before the installation process continues. The Unified Messaging installation program tries to detect Lotus Notes by searching for the notes.ini file on the hard drive. If the file is not found, the Lotus Notes option is disabled during installation. If the notes.ini file is located on a server, you can disable Lotus Notes detection to install Unified Messaging for Lotus Notes. To disable Lotus Notes detection:

a Quit the Unified Messaging installation program.

b Click the Start button and click Run. The Run dialog box appears.

c Click the Browse button and browse to where you downloaded Unified Messaging.

d Select CallPilotDesktopMessaging.exe and click the Open button. CallPilotDesktopMessaging.exe appears in the Open box.

e To CallPilotDesktopMessaging.exe add -a ld, so that what appears in the Open box is now CallPilotDesktopMessaging.exe -a ld.

f Restart the Unified Messaging installation program.

If you are installing Unified Messaging on a Windows 2000 system, a message appears that prompts you to enter your user name and password.

24 Click the Next button. The installation progress bar appears and indicates that files are being copied.
25 Click the **Finish** button to complete the installation.
If you chose to install the fax printer driver, the Fax Printer Driver dialog box appears.

![Fax Printer Driver dialog box](image)

26 Click the **Yes** button to continue.
If you are not already logged on with administrator privileges, the Administrator Logon Information dialog box appears. If you are logged on with administrative privileges, this dialog box does not appear and you can go to step 27.

![Administrator Logon Information dialog box](image)

27 Enter your user name and password, and click the **OK** button.
The **Installation Complete** screen appears.

![Installation Complete screen](image)
28 Click the **Finish** button. The Setup Complete screen appears.

29 Click the **Finish** button.
Setting the default e-mail client

After you install Unified Messaging, you must set the default e-mail client.

To set the default e-mail client

1. Click the Windows Start button, point to Settings and click Control Panel. The Control Panel window appears.
2. Double click the Internet Options icon. The Internet Properties window appears.
3. Click the Programs tab.
4. In the E-mail list box, make sure the client that is displayed is the e-mail client you are using. If another e-mail client is displayed, select the correct e-mail client from the E-mail list box, click the Apply button and click the OK button.

Configuring forwarding or replying mail delivery settings

To ensure you can forward or reply to Unified Messaging messages, you must check one of the default settings for mail delivery.

1. In your Inbox, click CallPilot Desktop Messaging.
2. Click CallPilot Configuration.
3. Click the Mail tab to display the current mail settings.
4. Check to see if the Include a message header when forwarding/replying checkbox is not selected. If you have a fax keycode enabled you can select this checkbox. If you do not have a fax keycode enabled do not select this checkbox.

Note: If the checkbox is selected and you have a fax keycode enabled, the header information of the original message appears in a reply or forwarded message. The message becomes a fax message because the headers are attached as a text message.

Do not select the Include a message header when forwarding/replying checkbox or add text to the message, although the New Text Message button is active, if you do not have a fax keycode enabled. If you add text or message headers to the message it does not remain as a voice message. It becomes a fax message.

If the Include a message header when forwarding/replying checkbox is selected without the BCM fax keycode the forward/reply message will not be delivered.

If Include a message header when forwarding/replying checkbox is not selected, the subject of a forwarded message contains the CLID information but, does not include the original sender’s name or the sent time.
Configuring mail delivery folders for Outlook

Microsoft Outlook is automatically configured when you install Unified Messaging. By default, CallPilot messages are stored in a separate message store from the Outlook Inbox. Nortel recommends that subscribers keep their CallPilot messages separate from their Outlook messages. Keeping CallPilot messages separate makes it easier to prioritize messages and identify message types.

If the subscriber requests it, you can configure Outlook to store all incoming e-mail and CallPilot messages in the CallPilot message store.

Note: If you configure the e-mail client to deliver messages to the CallPilot Inbox, all e-mail messages are stored on the subscriber’s hard drive. After the message is delivered, the messages no longer resides on the Exchange server.

To specify where to deliver e-mail messages

1. On the Outlook window, on the Tools menu click Services or if you use Outlook XP or 2003, click on the Tools menu and then click E-mail accounts. The E-mail account window appears. Select View or Change existing E-mail accounts. Click Next.

2. Click the Delivery tab.

3. From the Deliver new mail to the following location list, select CallPilot Messaging Store and click the up arrow to move it to the top of the list.

4. Click the OK button.
Configuring Outlook 2002 and 2003

Outlook 2002 and 2003 handle mail accounts differently than previous versions of Outlook. This section describes how to configure the Unified Messaging options for Outlook 2002 and 2003.

To set Unified Messaging options

1. In Outlook, on the Tools menu, click E-mail Accounts. The E-mail Accounts wizard appears.
2. Choose View or change existing e-mail accounts, and then click Next.
3. In the e-mail account list, choose CallPilot Desktop Messaging, and then click Change. The Desktop Messaging options dialog box appears.
4. Make changes to Unified Messaging settings, as required, and then click the OK button.
5. Click Finish to exit the E-mail Accounts wizard.

Using Outlook 2002 and 2003 as an Internet mail client

In Outlook 2002 and 2003, Corporate mode and Internet Mail do not exist. Instead, the subscriber can manage all Exchange server, IMAP and POP server, and web-based e-mail accounts from the same interface.

This section describes how to configure Outlook 2002 and 2003 as an Internet Mail client that works with Unified Messaging for Internet Mail clients.

If the subscriber uses Unified Messaging with an Exchange server, you should install Unified Messaging for Outlook on their computer. The Unified Messaging installation program automatically configures Outlook with the required settings.

To define the CallPilot mailbox settings

1. In Outlook, on the Tools menu click E-mail Accounts. The E-mail Accounts wizard appears.
2. Select Add a new e-mail account, and then click Next. The E-mail Servers page appears.
3. Select IMAP, and then click Next. The Internet E-mail Settings (IMAP) page appears.
4. Specify the settings for the subscriber’s CallPilot mailbox.
   - User Information — Type the subscriber’s name and CallPilot address in the boxes. Enter the address in the form:
     <SMTP/VPIM prefix><mailbox number>@[local CallPilot server>
   - Logon Information — Type the subscriber’s CallPilot mailbox number and password in the boxes.
   - Do not select the Log on using Secure Password Authentication (SPA) check box.
• **Server Information** — Enter the CallPilot fully qualified domain name (FQDN) for both the incoming and outgoing servers.

5 Click Next.  
A message appears that confirms the changes.

6 Click Finish.

**To configure access to the CallPilot Address Book**

1 In Outlook, on the Tools menu click E-mail Accounts.  
The E-mail Accounts wizard appears.

2 Select Add a new directory or address book, and then click the Next button.

3 Select Internet Directory Service (LDAP) and then click the Next button.

4 In the Server Name box, type the CallPilot FQDN.

5 In Logon Information, select This server requires me to log on check box.

6 Enter the user’s username and password in the User Name and Password boxes.  
The user name is the mailbox number and the password is the mailbox password.

7 Click the More Settings button.  
A message appears that says that the account you created will not start until you restart Outlook.

8 Click the OK button.

9 Under the Search tab in the Search Base box, type ou=users,ou=callpilot.

10 Click the OK button.

11 Click the Next button.  
A message appears that confirms the changes.

12 Click the Finish button.

**To configure text formatting**

1 In Outlook, on the Tools menu click Options.

2 Click the Mail Format tab.

3 In the Message Format section, select Plain Text.

4 Click OK.
Configuring Novell GroupWise

This section describes how GroupWise is integrated with CallPilot. For information on how to use GroupWise to address, compose, open, delete, and perform other CallPilot operations, refer to the *CallPilot 2.5 Unified Messaging User Guide for Novell GroupWise* or the online Help.

---

**Note:** If the subscriber uses Novell GroupWise, the subscriber must have Windows Messaging 4.0 installed on their computer. Windows Messaging is usually installed when Windows is installed on a computer. However, if Windows Messaging 4.0 is not installed, the GroupWise installation gives you these options:

- Install the complete Windows Messaging system.
- Leave Windows Messaging as is.

Install the Complete Windows Messaging system even if Windows Messaging is already installed. This ensures that the GroupWise option is available during Unified Messaging installation.

---

After you install GroupWise, you must configure it for Unified Messaging.

Removing the CallPilot Message Store

When you install Unified Messaging on the computer of a subscriber who uses GroupWise, the CallPilot Message Store folder is added to the subscriber’s GroupWise mailbox.

You or the subscriber can use this procedure to remove the CallPilot Message Store from GroupWise.

**To remove the CallPilot Message Store**

1. Click the Windows **Start** button, point to **Settings** and click **Control Panel**. The Control Panel window appears.
2. Click the **Add/Remove Programs** icon. The Add/Remove Programs Properties dialog box appears.
3. In the list select **CallPilot Unified Messaging for Novell GroupWise**.
4. Click the **Remove** button. The dialog window opens to confirm the deletion.
5. Click **OK**.

**To configure GroupWise for Unified Messaging**

1. Start GroupWise.
2. On the **Tools** menu click **CallPilot**, point to **CallPilot Configuration**, and click **CallPilot Configuration Menu**. The CallPilot Unified Messaging dialog box appears.
3 In the Server box, enter the Business Communications Manager system name or IP address.

4 In the SMTP/VPIM prefix box enter the SMTP/VPIM prefix of the subscriber’s address. If the Network Messaging option is not enabled, leave this box blank. If Network Messaging is installed, enter the value in CallPilot Manager, in the Digital Networking Properties page, in the Local Prefix box.

5 In the Mailbox box, enter the subscriber’s mailbox number.

6 On the Mail tab, select Manually at Check for new messages (Automatically/Manually), if the subscriber uses ISDN or dial-up. This option saves on toll charges by not continuously checking for new messages on the Business Communications Manager system.

7 On the Mail tab, select Include original message header when forwarding or replying, if you have a fax keycode enabled. This adds header information to each forward or reply, so that Unified Messaging messages are consistent with other e-mail messages.

**Note:** When you choose to include the original message header, when you forward or reply to a Unified Messaging message, the Business Communications Manager treats the voice message as a fax.

Do not select Include original message header when forwarding or replying, if you do not have fax enabled because the message will not be sent.

If you do not select Include original message header when forwarding or replying, the forwarded message contains the CLID information, but does not include the original sender’s name or sent time.

8 On the Mail tab, select Include cover page when forwarding fax.

If this option is selected, the user will be able to choose and set a default cover page from a list of available cover pages.

9 Select the Remember password check box if the subscribers do not want to enter their password each time they log on.

10 Click the Address Book tab.

11 In the Path box enter the location of the local CallPilot address book.

12 From the Order list box, select the order in which you want the names to be displayed in the address book.

13 Select the Remind me to download address book every __ day(s) if subscribers want to download addresses automatically from the system. The default is every 20 days. Subscribers can change the number of days, if they wish. If subscribers do not want to download the address book, do not select this check box.

14 If you want to download the address book now, click the Download now button. Subscribers can click this button whenever they want to download the address book.

15 Click the Apply button.

16 Click the Audio tab.

17 Select the Choose audio device before each audio session check box if the subscribers do not use either the telephone or computer to listen to their messages on a regular basis.
18 Click the **Download file before playing** check box if subscribers want to download messages before they play them. After the message downloads, subscribers can play the message additional times without delay, and use GroupWise to forward it to another CallPilot subscriber.

19 From the **Audio device** setting, select either **Computer** or **Telephone** as the playback and recording device. If you select **Telephone**, enter a telephone number and click **Add**. All telephone numbers are stored, which is useful if the subscriber listens to or records messages from multiple locations.

20 Click the **Apply** button.

21 Click the **Volume Control** tab.

22 Select the default speaker and microphone volumes from this tab. The microphone level can be changed only from this dialog box. The subscriber can change the volume level and the volume control on the player from this dialog box. The selected volume level is used for future player sessions.

23 Click **OK** to save your changes and close the dialog box.

## Configuring Lotus Notes

### Updating the Mail database

In Lotus Notes, the Mail database design determines which messages appear in the Notes message list. There are two ways to update the database design for Desktop Messaging:

- **automatic update**: this updates the database automatically when you install Unified Messaging (recommended).
- **manual update**: you or the subscriber must update the database manually after you install Desktop Messaging.

Nortel recommends the automatic update option. It provides the optimal configuration for message storage, is compatible with customized database designs, and does not require any manual updates to the database design.

### Updating the database automatically

To automatically update the Mail database, select the **Update Lotus Notes Databases** option when you install Unified Messaging. When the installation is complete, Unified Messaging is ready to use and does not require any manual changes to the Mail database.

When you use this update method, Lotus Notes stores CallPilot messages in a separate folder. This configuration lets users easily prioritize CallPilot messages since they are not mixed with other e-mail messages.
Updating the database manually

You should update the database design manually only if:

- the subscriber wants CallPilot messages stored in the same Inbox as their Lotus Notes e-mail messages
- the subscriber’s database design has not been customized, and the subscriber does not intend to customize the database design in the future
- you are familiar with modifying Lotus Notes database design

To perform a manual update, you must replace the current database design using a CallPilot template. Replacement of the database design removes any customization in the current database design.

To update the Mail database design manually

1. Start Lotus Notes.
2. On the Help menu select About Notes Desktop. Make a note of the version of Lotus Notes.
3. Click the Mail database. The Mail database has the subscriber’s name and the envelope icon.
4. On the File menu, click Database, and then click Replace Design. The Replace Database Design dialog box appears.
5. Select Template Server. The Template Server window appears.
6. Select Local, and then click OK.
7. Select the Show advanced templates check box.
8. From the list box, select the version of CallPilot Mail for the version of Lotus Notes that you use.
9. Click Replace. A message appears that asks you to confirm your request to change the database view.
10. Click Yes.

Removing password prompts

By default, Lotus Notes prompts for a Notes password when you access an application linked to Lotus Notes. This means that when Unified Messaging for Lotus Notes is installed, subscribers must enter their Notes password twice: when they start Lotus Notes, and the first time they access the Unified Messaging folder during the Lotus Notes session. To remove the Lotus Notes password prompt for Unified Messaging, subscribers must follow this procedure.
To remove the Lotus Notes password prompt for Unified Messaging

Lotus Notes 5.0:

1. In Lotus Notes, on the File menu click Tools and click User ID. The Enter Password dialog box appears.
2. Type your Notes password, and then click the OK button. The User ID dialog box appears.
3. Select the Don’t prompt for a password from other Notes-based programs option, and then click the OK button.

Lotus Notes 6.0:

1. In Lotus Notes, on the File menu, click Security and click User Security.
2. Type your Notes password, and then click the OK button.
3. Select the Don’t prompt for a password from other Notes-based programs option, and then click the OK button.

Configuring Internet Mail clients

CallPilot Unified Messaging supports these Internet Mail clients:

- Outlook Express
- Outlook in Internet mail mode
- Netscape Messenger
- Eudora Pro

Note: You must use at least the minimum supported version of the Internet mail client. In particular, Netscape Messenger versions earlier than 4.5 are incompatible with Unified Messaging. Your Information Systems administrator can give you more information on upgrading your Internet mail client.

You need the following information to configure your Internet mail client:

- the FQDN or IP address of the Business Communications Manager system
- the subscriber’s CallPilot mailbox number and password
- the SMTP/VPIM prefix of the Business Communications Manager system. If you use Message Networking, include this prefix. Enter the value from the Local Prefix box of the Digital Networking Properties page in CallPilot Manager.

You can provide this information to subscribers if you want them to configure the client.
Configuring Outlook Express or Outlook in Internet Mail mode

If your Internet Mail client is Microsoft Outlook Express or Outlook, use the following procedures. Depending on the Internet client you use, the options you see can be slightly different.

To configure an IMAP account on Outlook or Outlook Express

1. Start Outlook.
2. On the **Tools** menu:
   - if you use Outlook 2000, select **Services**
   - if you use Outlook 2002 or 2003, select **E-Mail Accounts**

   The Internet Accounts screen appears.

3. Click **Add**, and then click the **Mail** option.

   The Internet Connection Wizard starts up.

4. In the **Display name** box, type your name.

5. Click the **Next** button.

   The Internet Connection Wizard - Internet E-mail Address screen appears.

6. In the **E-mail address** box, type the subscriber’s CallPilot mail address in the form:

   14165556003@voiceuser.callpilot.com

   - 1416555 is the SMTP/VPIM prefix. If you use Message Networking, include this prefix.
   - 6003 is the CallPilot mailbox number.
   - voiceuser.callpilot.com is the FQDN of the Business Communications Manager system. If your network does not use DNS, enter <hostname>.localdomain as the FQDN (where the host name is that of the Business Communications Manager system).

7. Click the **Next** button.

   The E-Mail Server Names screen appears.

8. From the list box, choose **IMAP** as the incoming mail server type.

9. In the **Incoming mail server** box, type your FQDN.

10. In the **Outgoing mail server** box, type your FQDN.

11. Click the **Next** button.

    The Internet Mail Logon screen appears with the subscriber’s IMAP account name displayed.
In the **Password** box, type the subscriber’s CallPilot mailbox password. Do not select the **Log on using Secure Password Authentication (SPA)** check box.

13 Click the **Next** button.
The Internet Connection Wizard - Internet Mail Logon screen appears.

14 In the **Account name** box, type the subscriber’s SMTP/VPIM prefix and mailbox number.

15 In the **Password** box, type the subscriber’s mailbox password.

16 Click the **Next** button.
The Internet Connection Wizard - Congratulations screen appears.

17 Click the **Finish** button and close the Internet Accounts screen.
A message appears that asks if you want to download folders from the mail server you added.

18 Select the **Yes** button to download the folder list for the IMAP account that you just created or select the **No** button if you do not want to download the folder list at this time. **Tip:** To make changes to your new IMAP account, select the account name and click Properties to display the Properties page.

19 Click the **OK** button.

**To configure an LDAP directory service for Outlook Express or Outlook**

Depending on the Internet client you use, the options you see can be slightly different.

1 Start Outlook.

2 On the **Tools** menu, click **Accounts**.
The Internet Accounts screen appears.

3 Click the **Directory Service** tab.

4 Click the **Add** button and click **Directory Service**.
The Internet Connection Wizard starts.

5 In the **Internet directory (LDAP) server** box, type the FQDN or IP address of the Business Communications Manager system.

6 Select the **This server requires me to log on** check box. Then enter the **Account Name** or **User Name** and **Password**.
The user name or account name is the mailbox number. The password is the mailbox password.

7 Click the **Next** button.
The Internet Connection Wizard - Check E-mail Addresses screen appears.

8 If the subscriber wants to check for addresses in the CallPilot LDAP directory when they address messages, select **Yes**.

9 Click the **Next** button.
The Internet Connection Wizard - Congratulations screen appears.
10 Click the Finish button. The Internet Accounts screen appears.

11 Click the Properties button, and then click the Advanced tab.

12 If your network is slow, move the slide bar under Search timeout toward Long to increase the timeout.

13 If the subscriber expects to do directory searches that return more matches than the number shown, increase the number in the Maximum number of matches to return box.

14 In the Search base box, type the search base for the CallPilot directory. The search base is ou=users,ou=callpilot.

15 Click the OK button. The Internet Accounts screen appears again.

16 If the subscriber wants to check for addresses in the CallPilot LDAP directory, click the Set Order button. The Directory Services Order screen appears. If necessary, use the Move Up or Move Down buttons to position the CallPilot LDAP directory in the search order.

17 Click the OK button. The Internet Accounts screen appears.

18 Click the Close button.

To configure special settings for Outlook Express or Outlook in Internet Mail mode

1 Select the settings for the type of Outlook the subscriber uses.
   • If the subscriber uses Outlook Express:
     a On the Tools menu, click Options. The Options screen appears.
     b Click the Send tab.
     c From Mail sending format, select Plain Text.
     d Click the Plain Text Settings button. The Plain Text Settings screen appears.
     e From Message format, select MIME.
     f From the Encode text using list box, select None.
     g Click the OK button.
   • If the subscriber uses Outlook 98:
     a On the Tools menu, click Options.
     b Click the Mail Format tab.
     c From Send in this message format, select Plain Text.
     d Click the OK button.
2 If the subscriber has addresses from the CallPilot LDAP directory in their Outlook Express personal address book:
   - In the Address Book, right-click the recipient’s name.
   - Select Properties, and then select the Name tab. The Properties screen appears.
   - Select the Send E-Mail using plain text only check box.
   - Click the OK button.

To test the Outlook Express or Outlook in Internet Mail mode IMAP account
1 Use your telephone to log on to your CallPilot mailbox.
2 Compose a test voice message and send it to the subscriber.
3 Have the subscriber check that the message appears in their Outlook or Outlook Express Inbox.

Configuring Netscape Messenger
For subscriber who use Netscape Messenger as their Internet Mail client, use these procedures to configure Netscape Messenger.

Notes:
- If the subscriber uses Netscape with POP for e-mail, Netscape cannot be configured with IMAP at the same time. You must set up a different Netscape subscriber profile.
- If the subscriber uses Netscape for their e-mail, Netscape cannot be configured to send mail to CallPilot, since only one SMTP server can be configured. You must set up a different Netscape subscriber profile.
- The subscriber must have Netscape Messenger 6.2x or later. Other Netscape Messenger versions are incompatible with Unified Messaging.

To configure an IMAP account on Netscape Messenger
1 Start Netscape Messenger.
2 On the Edit menu, select Preferences.
3 From the Mail & Newsgroups category, select Identity. The Preferences screen appears.
4 In the Your name box, type the subscriber’s name.
5 In the **E-mail address** box, enter the subscriber’s e-mail address in the form:

\[14165556003@voiceuser.callpilot.com\]

- 1416555 is the SMTP/VPIM prefix.
- 6003 is your CallPilot mailbox number.
- voiceuser.callpilot.com is the FQDN of the Business Communications Manager system. If your network does not use DNS then use <hostname>.localdomain as the FQDN (where host name is that of the Business Communications Manager system).

6 From the **Mail & Newsgroups** category, select **Mail Servers**.

The Preferences screen appears.

7 Click the **Add** button.

The Mail Servers Properties screen appears with the General tab displayed.

8 In the **Server Name** box, type the FQDN of the Business Communications Manager system.

9 In the **User Name** box, type the part of the subscriber’s CallPilot mail address that comes before the at (@) sign.

10 In the **Check for mail every _ minutes** box, type how frequently you want Netscape Messenger to check for new messages.

11 Select the **IMAP** tab.

12 From **When I delete a message**, select **Mark it as deleted**.

13 Select the **Clean up (“Expunge”) Inbox on exit** check box.

14 Click the **OK** button.

You return to the Mail Servers screen.

15 In the **Outgoing mail (SMTP) server** box, type the FQDN or IP address of the Business Communications Manager system.

16 In the **Outgoing mail server user name** box, type the FQDN or IP address of the Business Communications Manager system.

17 From the **Mail & Newsgroups** category, select **Addressing**.

18 From **Pinpoint Addressing**, select both **Address Books** and **Directory Server**.

19 From the **Mail & Newsgroups** category, select **Messages**.

20 From the **By default, forward messages** list box, select **As Attachment**.

21 From **Send messages that use 8-bit characters**, select **Using the “quoted printable” MIME encoding**.
22 From the Mail & Newsgroups category, select Copies and Folders.
23 Make sure all the check boxes are clear.
24 From the Mail & Newsgroups category, select Formatting.
25 From Message formatting, select Use the plain text editor to compose messages.
26 From the Mail & Newsgroups category, select Return Receipts.
27 From If I request a receipt when sending a message, I want, select A delivery receipt from the receiving server (DSN).
28 From When a receipt arrives, select Leave it in my Inbox.
29 Click the OK button.

To configure an LDAP directory service for Netscape Messenger

1 Start Netscape Messenger.
2 On the Communicator menu, select Address Book.
   The Address Book screen appears.
3 On the File menu, select New Directory.
   The Directory Server Property screen appears.
4 In the Description box, type a descriptive name for the subscriber’s CallPilot directory service.
5 In the LDAP server box, type the FQDN of the Business Communications Manager system.
6 In the Search Root box, type the search base.
   Use the search base ou=users,ou=callpilot.
7 Click the OK button.

Note: Netscape Messenger 6.2x LDAP directory service will not work with Business Communications Manager 4.0, because Netscape Messenger 6.2x does not support LDAP directory authentication,

To test the Netscape Messenger IMAP account

1 Use your telephone to log on to your CallPilot mailbox.
2 Compose a test voice message and send it to the subscriber.
3 Have the subscriber check that the message appears in Netscape Messenger
Configuring Netscape Messenger to store messages locally

You must configure subscribers’ accounts to store messages locally rather than on the IMAP server.

To configure Netscape Messenger 6.2x

1. On the Edit menu, click Preferences. The Mail & Newsgroups account settings dialog box appears.

2. At the Place a copy in setting, select Sent Folder on, and from the list box, select Local Folders.

3. At the Keep Messages and Drafts in setting, select Drafts Folder on, and from the list box, select Local Folders.

4. At the Keep Message Templates in setting, select Templates Folder on, and from the list box, select Local Folders.

5. Click the OK button.
Configuring Netscape Messenger deletions

If subscribers use Netscape Messenger 6.2x, you must configure their inbox to handle message deletion.

1. On the **Edit** menu, click **Preferences**. The Mail & Newsgroups account settings dialog box appears.

2. From the **When I delete a message** list box, select **Mark it as deleted**.

3. Select the **Clean up ("Expunge") mailbox on exit** check box. This will cause messages to be marked as deleted in the client and the telset when they are deleted from Netscape. When the Netscape 6 client is closed or a telset session is logged out, the messages marked as deleted will be physically deleted.

4. Click the **OK** button.

**To configure an IMAP account on Netscape Mail 7.0**

Refer to the Netscape online help and choose IMAP server settings.
For the email address, enter the email address in this form:

14165556003@voiceuser.callpilot.com

- 1416555 is the SMTP/VPIM prefix.
- 6003 is your CallPilot mailbox number.
- voiceuser.callpilot.com is the FQDN of the Business Communications Manager system. If
your network does not use DNS then use <hostname>.localdomain as the FQDN (where
host name is that of the Business Communications Manager system).
- For the server name, type the FQDN of the Business Communications Manager system.
- For the user name, type the part of the subscriber’s CallPilot mail address that comes
before the at (@) sign.
- For the Outgoing mail (SMTP) server, type the FQDN or IP address of the Business
Communications Manager system.
- For the Outgoing mail server user name, type the FQDN or IP address of the Business
Communications Manager system.

To configure an LDAP directory service for Netscape Mail 7.0

1 Start Netscape.
2 On the Navigator menu, select the Window menu, and then choose Address Book.
The Address Book screen appears.
3 On the File menu, select New, and then choose LDAP Directory.
The Directory Server Property screen appears.
4 In the Name box type the name of the directory service.
5 In the Host Name box type the FQDN or IP address of the Business Communications Manager system.
6 In the Base DN box type ou=users,ou=callpilot.
7 In the Port Number box type the port number for the LDAP server. The default is 389.
8 In the Bind DN box type the name that is used to authenticate (log in) to the LDAP server.
The name is the mailbox number.
9 Do not select the Use secure connection (SSL) check box.
Configuring Eudora Pro

To change any part of this configuration after it is complete, on the Tools menu click Options to display the configuration screens.

To configure an IMAP account on Eudora Pro

1. Double click the Eudora Pro icon.
   The New Account Wizard - Welcome to Eudora Pro! screen appears.

2. Click the Next button.
   The New Account Wizard - Account Settings screen appears.

   **Note:** If you have another IMAP account for your CallPilot mailbox, you can import the settings. This configuration assumes that the Eudora IMAP account is a new configuration.

3. From Would you like to, select Create a brand new e-mail account.

4. Click the Next button.
   The New Account Wizard - Personal Information screen appears.

5. In the Your Name box, type the subscriber’s name.

6. Click the Next button.
   The New Account Wizard - E-Mail Address screen appears.

7. In the E-Mail Address box type the subscriber’s CallPilot mail address.

   Enter the subscriber’s e-mail address in the form:

   14165556003@voiceuser.callpilot.com

   - 1416555 is the SMTP/VPIM prefix.
   - 6003 is the subscriber’s CallPilot mailbox number.
   - voiceuser.callpilot.com is the FQDN of the Business Communications Manager system. If your network does not use DNS, use <hostname>.localdomain as the FQDN (where hostname is that of the Business Communications Manager system).

8. Click the Next button.
   The New Account Wizard - Logon Name screen appears.
Check that the Logon Name box contains the part of the subscriber’s CallPilot mail address that comes after the at (@) sign, and click the Next button. The New Account Wizard - Incoming E-Mail Server screen appears.

Check that the Incoming Server box contains the FQDN of the Business Communications Manager system.

From Please choose whether the server for your incoming mail uses POP or IMAP, select IMAP, and click the Next button. The New Account Wizard - IMAP Location Prefix screen appears.

Click the Next button without entering a location prefix. The New Account Wizard - Outgoing E-Mail Server screen appears.

Check that the Outgoing Server box contains the FQDN or IP address of the Business Communications Manager system, and then click the Next button.

Click the Finish button.

On the menu bar, on the Tools menu click Options.

From the Category heading, click the Attachments icon. The Options screen appears.

From Encoding method, select MIME.

From the Category heading, click the Styled Text icon.

From the When sending mail with styled text (HTML), select Send plain text only.

Click the OK button. You return to the main screen.

To configure an LDAP directory service for Eudora Pro

Start Eudora Pro.

From the Protocols box, select LDAP.

Click the New Database button. The Modify Database screen appears.

Click the Network tab.

In the first box, type a descriptive name for the CallPilot directory service.

In the Host Name box, type the FQDN or the IP address of the Business Communications Manager system.

Select the This server requires me to log on check box. Then enter the Account Name and Password. The account name is the mailbox number and the password is the mailbox password.

Click the Search Options tab.

If your network is slow, move the slide bar under Search timeout toward Long to increase the timeout.
11 In the **Search Base** box type the search base for the CallPilot directory. The search base is `ou=users,ou=callpilot`.

12 Click the **OK** button.
   You return to the Directory Services screen.

**To test the Eudora Pro IMAP account**

1 From your telephone, log on to your CallPilot mailbox.
2 Compose a test voice message and send it to the subscriber.
3 Have the subscriber check that the message appears in their Eudora Pro client.
Installing Unified Messaging in a Citrix Thin Client environment

The system administrator of a Citrix Thin Client environment must install and configure Unified Messaging on the Windows Terminal Server before users can access it. Unified Messaging should only be installed on the Windows Terminal Server; do not install Unified Messaging on the client computer.

Supported Platforms

Unified Messaging in the Citrix Thin Client environment is supported on the Business Communications Manager platform.

The Unified Messaging client supports:

- Citrix Metaframe 1.8 on Windows 2000 Server (All Editions)
- Citrix Metaframe XP on Windows 2000 Server (All Editions)

Citrix Thin Clients must be running Windows 2000, or Windows XP.

Installing Unified Messaging on the Windows Terminal Server

Installing Unified Messaging in a Citrix Thin Client environment is a straightforward process. It is nearly identical to installation in a standard desktop client environment. Deviations from the standard environment are detailed in this section.

The common desktop exceptions to the installation process for a standard environment include:

For Microsoft Outlook and Novell GroupWise: The installer automatically disables the Update default mail profile feature. This feature is not applicable to the Windows Terminal Server.

For Lotus Notes: The installer automatically disables the Update Lotus Notes mail database and Update Lotus Notes Personal Address Book features. These features are not applicable to the Windows Terminal Server.

To update the users mail databases, the Lotus Notes/Domino server administrator must run the LNSERVER.EXE installation program on the Lotus Notes/Domino Server. The administrator can then use the installed utility application to update selected user mail databases with CallPilot design elements. For more information refer to, “Updating the mail database manually” on page 59.

To enable the CallPilot address book, the Lotus Notes/Domino Server administrator must populate and maintain the CallPilot Public Address book on the server. The administrator may choose to call NMLNADBK.EXE as a scheduled task to automate the CallPilot Public Address Book update. For more information refer to, “To set up the automatic update utility” on page 60.
Configuring Unified Messaging in a Citrix Thin Client environment

When publishing applications on the Windows Terminal Server, the system administrator should manually update the program’s command line. This is required to provide access to the Nortel Fax/Nortel Fax Batch printers.

This step may be skipped if access to the Nortel Fax/Nortel Fax Batch printers is not required. This step may also be skipped when publishing the Windows’s desktop.

Providing access to the Nortel Fax/Nortel Fax Batch printers

1. Add double quotes around the original command line (if not already present).
   “C:\Lotus\Notes\notes.exe”

2. Add the following text in front of the quoted command line for any application from which you wish to print (not just Lotus Notes):
   "C:\Program Files\Nortel\CallPilot\fax\daemon" -P (or in some cases -A)
   The command line should now read:
   "C:\Program Files\Nortel\CallPilot\nda\daemon" -A “C:\Lotus\Notes\notes.exe”
   (the use of -A in this example, as opposed to -P, is explained below)

Note: The default installation location is “C:\Program Files\Nortel\CallPilot.” However, this may have been altered by the system administrator when CallPilot was installed.
The -P option should work for most applications. However, if an application still does not work with the Nortel Fax/Nortel Fax Batch printers, use the option -A instead of -P. Lotus Notes requires -A instead of -P.

The -P and -A options are both used by daemon.exe to monitor the original application for print requests. The -P option instructs daemon.exe to monitor only the original application. The -A option instructs daemon.exe to monitor the original application as well as any secondary applications created by the original. The -A option is more CPU intensive and should only be used when the -P option does not work.

**Printing faxes**

The system administrator must set up permission for each user to print faxes.

1. Make the user a member of the administration or a power user group.
2. Give the user modify permissions for the CallPilot or nda folder and subfolders.
3. Manually create a user folder in the nda directory.

**Citrix Thin Client Configuration overview**

Citrix Thin Client support allows users to access most of the features of the Unified Messaging Client in a Windows Terminal Server environment running Citrix software. This environment provides a single point of administration for all users in the network.

When the system administrator installs Unified Messaging on the Windows Terminal Server, users only need to perform minor (if any) configuration changes to use the application.

Once Unified Messaging has been configured, using it in a Citrix Thin Client environment is nearly identical to using it in a Standard Desktop Client environment.

One of the few limitations of the Citrix Thin Client environment is the inability to adjust the client’s speaker volume and microphone level. Adjusting these settings only affects the Windows Terminal Server. Therefore, the speaker volume and microphone level controls are disabled in the CallPilot Audio Player.

Configuration differences from the standard Desktop Client environment are detailed in the following sections.

**Configuring Microsoft Outlook**

The Citrix Administrator performs the following steps so Citrix users can automatically configure Unified Messaging using Microsoft Outlook.

1. Publish an application and call it CallPilot Desktop client or another name of their choice.
2. Configure the Command Line field for the application to:
   
   ```
   C:"\Windows directory"\system32\nmmdcinst.exe -i -default
   ```

   and

   Working Directory to: C:"\Windows directory"\system32
3  Save the application.

Once the administrator had installed Unified Messaging on the Windows Terminal Server, each Citrix Thin Client user must add Unified Messaging to their client computer's mail profile.

**Automatic Configuration**

Users can automatically add Unified Messaging to their default e-mail profile. Users click on the published application that the Citrix Administrator created.

After the Citrix users run the published application, Microsoft Outlook is configured for CallPilot and they do not run the application again.

Citrix users can also manually configure their Outlook profile.

**Manual Outlook 2002 (XP) and 2003 Configuration**

The user can manually add Unified Messaging to any e-mail profile in Outlook.

**To manually configure Unified Messaging**

1  Open the mail control panel applet.

2  In the Mail Setup dialog box, click **E-mail Accounts** to add CallPilot to the current e-mail profile, or click **Show Profiles** to choose another profile.

   If you click Show Profiles, then:

   a  Select the profile you wish to use.

   b  Click **Properties**.

   c  Click **E-mail Accounts**.
3 In the E-mail Accounts dialog box, select **Add a new e-mail account** and click **Next**.

4 Select **Additional Server Types** and click **Next**.
5  Select **CallPilot Desktop Messaging** and click **Next**.

6  Click **Open** in the **Create/Open CallPilot Address Book File** window.

The default location in the **Create/Open Address Book File** window is set to the user’s profile section on the Windows Terminal Server. The location of the user’s profile in the default location prevents inadvertent access or overwrite of another user’s files.

Nortel does not recommend changing the default location of the Address Book file. If the Address Book location is changed, conflict with other users can occur.

Initially, changing the location of the Address Book File to a location shared by all users can seem worthwhile. The system administrator then can maintain one copy of the Address Book to be shared by all users. However, a shared address book can contain entries (SDLs, BDLs, or PDLs) not applicable to all users. While the CallPilot Server prevents unauthorized use of Address Book entries, sharing the address book file among multiple users can cause confusion.
Since the address book files for all users are stored on the same computer, users need to be aware of how secure their data is. The level of security depends upon how the Windows Terminal Server has been configured by the system administrator. Click Open in the Create/Open CallPilot Message Store File window.

Nortel does not recommend changing the default location of the Message Store file. If the user changes the location of the Message Store file, it can conflict with another user. The location of the user’s profile in the default location prevents inadvertent access or overwrite of another user’s files.

7 Enter your CallPilot Mailbox Number in the Mailbox field and click OK.

8 Download the CallPilot Address Book (if prompted).

9 If you choose to download the Address Book, click OK to when the download is complete.

10 Close any remaining windows to complete the configuration.
Manual Outlook 2000 Configuration

The user can manually add CallPilot Desktop Messaging to any e-mail profile in Outlook 2000.

To manually configure CallPilot Desktop Messaging for Outlook 2000

1  Open the mail control panel applet.

2  Click Add... to add CallPilot to the current e-mail profile, or click Show Profiles... to choose another profile.

If you click Show Profiles..., then:

   a  Select the profile you wish to use.

   b  Click Properties.

   c  Click Add.

3  In the Add Service to Profile dialog box, Select CallPilot Desktop Messaging and click OK.

4  Click Open in the Create/Open CallPilot Address Book File window.

The default location in the Create/Open Address Book File window is set to the user's profile section on the Windows Terminal Server. This prevents one user from inadvertently accessing or overwriting another user's files.

Nortel does not recommend changing the default location of the Address Book file. If the user changes the location of the Address Book file, changing location can conflict with another user.

Since the address book files for all users are stored on the same computer, users need to be aware of how secure their data is. The level of security depends upon how the Windows Terminal Server has been configured by the system administrator.
5  Click Open in the Create/Open CallPilot Message Store File window.

Nortel does not recommend changing the default location of the Message Store file. If the user changes the location of the Message Store file, it can conflict with another user. The location of the user’s profile in the default location prevents inadvertent access or overwrite of another user’s files.

6  Enter your CallPilot Mailbox Number in the Mailbox field and click OK.

7  Close any remaining windows to complete the configuration.
Chapter 3 Installing and configuring Unified Messaging

Configuring Lotus Notes

The administrator must install Unified Messaging on the Windows Terminal Server and update the mail databases on the Domino server. Once this is done, Citrix Thin Client users can run the CallPilot-enabled Lotus Notes client.

When Lotus Notes Client starts for the first time after server configuration is completed, Unified Messaging detects the updated mail database, makes all required modifications in Lotus Notes client initialization file (NOTES.INI) and prompts the user to finalize the configuration by restarting the Lotus Notes client.

Note: The administrator must download CallPilotLotusServerTools.exe, from the Business Communications Manager web page, to manually update the mail databases. The administrator can use the Lotus Notes Server Tools to:

- place CallPilot messages within the Lotus Notes Inbox with e-mail messages
- update the user mail database on the Lotus Notes Server
- configure the automatic update utility as a scheduled task to update the CallPilot address book stored on the Notes server

Updating the mail database manually

A Lotus Notes administrator can manually update one or more mail databases from the Lotus Notes server by running an update utility. By running the update utility, you can add the Unified Messaging folders and views to the user's mail database without affecting any previous customization to the database.

Alternatively, a Lotus Notes administrator or user can replace the database design. Replacement of the mail database removes all customization to the database. Administrators and users should only replace the database under special circumstances. Users may consider replacing database design only if they want CallPilot messages to be placed within the Lotus Notes Inbox, along with e-mail messages.

To update the database design from the Lotus Notes server

1. Download the CallPilotUnifiedMessagingLotusServertools.exe from the Business Communications Manager web page.
2. Run CallPilotUnifiedMessagingLotusServertools.exe from the Lotus server. This installs LNSERVER.EXE files on the Lotus server and automatically runs LNSERVER.EXE.
3. Start Update database design. From the Start menu, choose Programs>Nortel CallPilot Unified Messaging>Update Database Design. The Update CallPilot mail databases dialog box appears.
4. Select Add CallPilot components, and then click OK. The Select database(s) dialog box appears.
5 Select mail files to update, and then click Open.

**To set up the automatic update utility**

1 Run LNSERVER.EXE if it has not already been run.
   To avoid entering the Lotus Notes password multiple times, configure Notes to share the Notes password with Notes programs. For more information, see “Password prompts” on page 60.

2 Open the Public Address Book.

3 Navigate to Folders and Views/Servers/Program.

4 Select Program, and then click Add Program.
   The Program page appears.

5 Type nmlnadbk.exe in the Program name box. Ensure the Command line box is empty.

6 Set Enabled/disabled to ENABLED.

7 Select the time and frequency that you want the update utility to run.

8 Click Save, and then close the dialog box.
   Notes updates the address book based on the specified schedule.

**Password prompts**

By default, Lotus Notes prompts for a Notes password when you access an application linked to Lotus Notes. When Unified Messaging for Lotus Notes is installed, you must enter the Notes password twice - when you start Notes, and the first time you access the Unified Messaging folder during the Notes session. If desired, users can disable the Notes password prompt for the Desktop Messaging folder.

**To disable the Notes password prompt for Unified Messaging**

1 In Notes, choose File> Tools> User ID.
   The Enter Password dialog box appears.

2 Type your Notes password, and then click OK.
   The User ID dialog box appears.

3 Check the option: Don't prompt for a password from other Notes based programs.

4 Click OK.

**Configuring Novell GroupWise**

The administrator must first install Unified Messaging on the Windows Terminal Server. Once this is done, each Citrix Thin Client user must add Unified Messaging to their client computer Novell Default Settings mail profile.
Automatic Configuration

Users can automatically add Unified Messaging to their Novell Default Settings mail profile by choosing Start-> Programs-> CallPilot Desktop Messaging-> Add CallPilot to Default Mail Profile.

Note however that the automatic Novell GroupWise configuration is only available when the Windows Terminal Server administrator has published the Window's desktop. Otherwise, all users must manually configure Novell GroupWise.

Manual Configuration

Users can manually add Unified Messaging to their Novell Default Settings mail profile.

To manually configure CallPilot

1. Log on to Novell GroupWise.
2. Open the address book.
4 Once the Novell Default Settings Properties window appears, follow the steps in the section Manual Outlook 2000 Configuration to configure the CallPilot Desktop Messaging service, even if Outlook XP is installed on the computer.

5 Once configuration is complete, close and restart GroupWise.

Feature Limitations

There are some Unified Messaging feature limitations when you use a Citrix Thin Client.

Microsoft Outlook

Users of CallPilot Desktop Messaging have the ability to toggle between the CallPilot and Standard E-mail form. This setting is maintained in the HKEY_CLASSES_ROOT registry key.

In a Citrix Thin Client environment, all client computers refer to the same HKEY_CLASSES_ROOT registry key on the Windows Terminal Server.

As such, only the system administrator can toggle between the Standard Email and CallPilot forms, and the form they pick will apply to all users. The CallPilot installer will default to the CallPilot form.

In a Citrix Thin Client environment, all client computers must add CallPilot Desktop Messaging to their e-mail program. In a Standard Desktop environment, this is handled automatically by installation.

Lotus Notes

Users of the Lotus Notes CallPilot Desktop client must use the CallPilot Public Address Book located on the Lotus Notes/Domino Server.
Audio Player

There is a slight delay when the user clicks CallPilot Player buttons. The user will not be able to adjust the speaker volume from the CallPilot Audio player, CallPilot form, or CallPilot configuration. The user will not be able to use the CallPilot Audio Player microphone to record messages.

Fax Application

If the system administrator has installed CallPilot Desktop Messaging for more than one client (Outlook, Notes, GroupWise, Internet Mail) on the Windows Terminal Server, the Compose Fax dialog will list all available desktop clients that can be used to send the fax. This option is "sticky", meaning that the last option chosen is the first option shown the next time around.

In a Citrix Thin Client environment, this option is still "sticky", but it is controlled by all client machines. The last option chosen by any client machine will be the first option shown the next time regardless of the client machine.

Tracing

Running CPTrace won’t show trace statements unless the system administrator has enabled CPTrace on the Windows Terminal Server.

Localization

While CallPilot Desktop Messaging supports several languages, only one language can be installed at a time. This prevents multiple languages from being installed on the Windows Terminal Server. All CallPilot users in a Citrix Thin Client environment must use the same language. This language can be non-English.

Installation

The system administrator must manually modify the command line of all published applications to provide access to the Nortel Fax / Nortel Fax Batch printers. Failure to do so prevents Citrix users from printing to the Nortel Fax / Nortel Fax Batch printers.

Security

The user does not have direct control over the file level access privileges of their CST file. This may leave their CST files (and the messages they contain) playable or viewable by other users if the Windows Terminal Server system administrator has not properly secured these files.
Windows XP

The Windows Terminal Server requires a Windows 2000 Server OS. Windows XP is not a server OS and will not be supported as a Windows Terminal Server running Citrix Metaframe software. Windows XP will be supported as a thin client running Citrix ICA software.
Chapter 4
Troubleshooting

This chapter is about:

- Troubleshooting during installation
- Troubleshooting logon problems
- Troubleshooting Outlook 2002 problems
- Troubleshooting Lotus Notes logon problems
- Troubleshooting after logging on
- Internet Mail client error messages
- Accessing Unified Messaging online Help
- Using Unified Messaging Support Tools
- CPTrace

This chapter discusses problems that subscribers can experience with Unified Messaging. The troubleshooting information is divided into problems and suggested solutions. Based on the expertise of subscribers, you can ask them to do some of the troubleshooting procedures.

If the suggested solution does not correct the problem, contact your Nortel representative.

The problems discussed here apply to all clients unless otherwise noted. Perform the suggested procedures from the desktop computer, or, where noted, the Business Communications Manager or administration client.

Troubleshooting during installation

Before you begin to install Unified Messaging for Microsoft Outlook, GroupWise, or Lotus Notes, you require:

- the subscriber’s CallPilot mailbox number
- the fully qualified domain name of the Business Communications Manager
- the SMTP/VPIM prefix of the Business Communications Manager

Note: Before you install Unified Messaging, make sure the Integrated Client (Microsoft Outlook, GroupWise, or Lotus Notes) is working properly.

To obtain the Unified Messaging version number

1. If the subscriber cannot log on, but you require the CallPilot version number, navigate to: windows\system\umdcva.exe
2. Right-click the file and select Properties.
   The Properties page appears.
3 Select the Version tab.
The version number for Unified Messaging is displayed.

**Microsoft Outlook default mail client**

You see the error message when you install Unified Messaging: “Either Outlook is not the default mail client or there is no default mail client to fulfill the current request.” If Outlook is installed on the subscriber’s computer but they do not want Outlook as the default mail client, the subscriber can change to another client after Unified Messaging is installed.

**To define Outlook as the default mail client:**

1 Click the Windows Start button, point to Settings and click Control Panel. The Control Panel window appears.
2 Double-click the Internet Options icon. The Internet Properties dialog box appears.
3 Click the Programs tab.
4 From the E-mail list box, select Microsoft Outlook.
5 Click the OK button.

**No authorization to perform this operation**

Subscribers must have Manager or Designer access control of the mail database to install Lotus Notes Unified Messaging. The Lotus Notes administrator sets this control on the server for each subscriber. The default is Manager access.

**To determine the level of access control for a subscriber**

1 From the subscriber’s Lotus Notes Mail database, click File, click Database, and click Access Control.
2 Click the subscriber’s name in the displayed list. The subscriber’s access control level appears in the Access box. The choices are Manager, Designer, Editor, Author, Reader, Depositor, and No Access. For a subscriber to install Unified Messaging, Manager or Designer must be displayed.
3 If neither Manager nor Designer is selected:
   — you must temporarily give the subscriber Manager or Designer access or
   — the Lotus Notes administrator must manually update the Mail database from the server for each subscriber who needs CallPilot access.

This update creates a new view, CallPilot Unified Messaging, in Lotus Notes.
To update a CallPilot subscriber Mail database from the server:

1. Install CallPilot Unified Messaging on the Lotus Notes server computer by running Server, setup.exe.
2. Start Update database design.
3. To locate the Update database design program, click Start, point to Programs, point to Nortel CallPilot Desktop and click Update database design.
4. From Update CallPilot Mail databases, select Add CallPilot components or Remove CallPilot components.
5. Click OK.
6. From the Select database(s) dialog box, select one or a group of mail files to update.
7. Click the OK button.

**Fax Printer Driver does not install**

If a subscriber is installing Unified Messaging and tries to install the Fax Printer Driver, the fax driver installation fails after the subscriber is prompted for the administrator user name and password. (Unified Messaging still installs correctly.) This failure occurs if the client PC is running Windows 2000 with SP4 or later, and the subscriber performing the installation does not have administrator privileges.

To resolve this, you must alter the security policy of the subscriber performing the installation to allow the user to impersonate a client after authentication. Refer to the online Microsoft Knowledge Base article Q821546 for more information.
Troubleshooting logon problems

Invalid credentials

The subscriber sees messages such as “Invalid credentials. Please retry” or “The server could not be located. Please Retry.”

1 On the subscriber’s computer, check that Unified Messaging is configured with the proper settings. Verify that the following information is correct:
   - mailbox number
   - fully qualified domain name (FQDN) or IP address of the Business Communications Manager
   - the SMTP/VPIM prefix of the Business Communications Manager

2 Check that you can log on from the telephone using the same mailbox number and password.

3 Verify that you have network connectivity to the Business Communications Manager.

   For example, issue a network command to the Business Communications Manager exactly as it appears in your Unified Messaging configuration. Try to ping using the DOS prompt, and ensure that you receive a valid response from the Business Communications Manager. If you do not have network connectivity to the Business Communications Manager, you are not able to access Unified Messaging.

4 Ensure that DNS is configured on this computer. Under TCP/IP properties, select the DNS tab. Ensure that a DNS server is listed. Verify that it is the correct IP address for the DNS server.

5 Check with the DNS administrator whether the server name is in the DNS server. Verify that the correct host name is configured in the DNS server.

6 The following actions can be taken to resolve this situation:
   - Properly configure the CallPilot FQDN in the DNS server.
   - Refer to “Configuring environments without a DNS” on page 16 for instructions on configuring CallPilot Unified Messaging in an environment with no DNS server.
No desktop capabilities

The subscriber tries to log on and sees this message:

If this occurs, make sure that:

- you have enabled enough desktop messaging keycodes. If there are not enough keycodes enabled the subscriber will be able to log in to the mailbox through the telephone interface but not the desktop.
- there are enough mailbox keycodes enabled to support the number of mailboxes that are initialized in the system. If you have used all the mailboxes available on your system the subscriber will not be able to log on to the mailbox from the telephone or desktop.

CallPilot Logon Failure

The subscriber sees a message that the computer is not connected to the network.

Tell the subscriber to contact their network administrator.
Troubleshooting Outlook 2002 problems

The following issues can arise when Unified Messaging and Outlook 2000 work together. These issues should be resolved with a Microsoft Outlook service release patch.

Sending messages

When a subscriber who uses Outlook 2002 creates a CallPilot message in the CallPilot window, Outlook does not automatically send the message when the subscriber clicks the Send button. To send the message, the subscriber must click the Send/Receive button on the Outlook toolbar. To fix this issue, Nortel recommends subscribers install Outlook 2002 SP 1 from Microsoft.

Accessing CallPilot support tools in Outlook 2002

This section describes how to use CallPilot support tools specific to Unified Messaging for Outlook 2002.

To reset the CallPilot Message Store in Outlook 2002

1. On the subscriber’s computer, press the Ctrl and Shift keys.
2. In Outlook, on the Tools menu, click Send/Receive, Accounts, CallPilot Desktop Messaging.
3. Continue to press the Ctrl and Shift keys until the CallPilot Reset Mailbox dialog box appears.
4. Click Reset Mailbox.

To access the Outbox Fix utility in Outlook 2002

1. In Outlook, on the Tools menu click E-mail accounts. The E-mail Accounts wizard appears.
2. Select View or change existing e-mail accounts, and then click Next.
3. In the e-mail account list, select CallPilot Unified Messaging.
4. While you press the Ctrl and Shift keys, click Change. The CallPilot Outbox Fix dialog box appears.
5. Click Fix outbox.
Troubleshooting Lotus Notes logon problems

When Unified Messaging is installed, Unified Messaging appears under Folders and Views. In the Personal Name and Address Book on Local database, two new views are created:

- Groups (CallPilot)
- People (CallPilot)

**Note:** In Lotus Notes 5.0 these views are accessible only from the View menu. In Lotus Notes 5.0 subscribers must log on to CallPilot before they can download the address book.

In Lotus Notes 6.0 these views are accessible from the Contacts menu.

Subscribers cannot see CallPilot Unified Messaging

When the subscriber logs on, they do not see Unified Messaging.

1. Verify that the subscriber is in *Folders and Views*.
2. If they do not see Unified Messaging and they are in Folders and Views, ask the subscriber to uninstall the current version of CallPilot, and then reinstall it. When they reinstall, tell them to make sure that when they reach the Ready to Install window they select the Update Lotus Notes databases check box.

**Note:** Even if the subscriber does not select the check box, you can manually update the Mail database design.

Replace the Mail database design only if you have not customized Lotus Notes. If you replace the database design, any customization is removed.

You require Manager- or Designer-level access to update the Mail database design.

Replacing the Mail database design

The Lotus Notes administrator can replace the Mail database design from the Lotus Notes server.

To update the Mail database design

1. If you use Lotus Notes 5.0, copy the file cpmail50.ntf for Lotus Notes 5.0 into the notes/data directory on the Lotus Notes server.
   If you use Lotus Notes 6.0, run LNSERVER.EXE to copy the cpmail60ntf file.
2. Use **File > Database > Open** to add the mail database icon that you are going to update.
3. Select this icon.
4. Select **File > Database > Replace design**.
5. In the **Replace Database Design** window, select the **Show advanced templates** check box.
Chapter 4  Troubleshooting

6  Make sure that:
   • the Inherit future design changes check box is selected
   • Hide formulas and LotusScript is not selected

7  Select CallPilot Mail (R5.0) or (R6.0), depending on which version of Lotus Notes you use.

8  Click Replace.

9  Press F9 to refresh the window and display the names.

No entries in CallPilot Personal Name and Address Book

While in the Personal Name and Address Book window, the subscriber selects People (CallPilot) and does not see any entries in the CallPilot Address Book.

Ask the subscriber to download the CallPilot Address Book manually and update the Personal Address Book template.

To manually download the CallPilot Address Book:

1  Make sure that Address Book—People (CallPilot) window is the active window.

2  On the Actions menu, select Download CallPilot Address Book.

The dynamic link library nNOTES.dll could not be found in the specified path

1  On your desktop, right-click the Lotus Notes icon, select Properties, and then click the Shortcut tab.

2  Examine the properties of your Lotus Notes shortcut.

3  Verify the path in the Start in box.
   Note: Usually, when Lotus Notes creates a shortcut, it puts a working directory in this box.

4  Add or update the path.

You download the CallPilot address book and 0 entries are found

1  Check the CallPilot Address Book search base.
   Search base is configured under Actions > CallPilot Desktop Messaging > CallPilot Desktop Messaging. Select the Address Book tab.

2  Verify that the search base is exactly as it is configured on the CallPilot Administration Client.
Troubleshooting after logging on

The CallPilot address book is empty
Lotus Notes subscribers must log on to CallPilot before they can download the address book.

1. Make sure that your Address Book—People (CallPilot) window is the active window.
2. On the Actions menu, click Download CallPilot Address Book.
3. On the View menu, click Refresh.
4. Make sure the CallPilot Address Book has been downloaded.

Outlook and GroupWise clients:
1. Click Download CallPilot Address Book.
2. If it responds with 0 entries found, verify that the search base is correct.

The subscriber has message access problems
The subscriber has modified the settings so that they are now correct, but the subscriber still cannot access messages.

If the subscriber modified the settings while Unified Messaging was open, close and reopen Unified Messaging so that the settings take effect.

The subscriber has problems sending messages
When the subscriber sends a message, it arrives in the recipient’s Outlook mailbox, but it does not arrive in the CallPilot message mailbox.

1. Ensure that when you address the message, you locate the recipient’s address in the CallPilot Address Book. If the recipient is defined in your Personal Address Book, then ensure that the Personal Address Book entry is a CallPilot address.
2. To ensure that the recipient is defined as a CallPilot Address type, highlight the name, click Properties, and verify that the Address Type=CallPilot.
3. Before you send the message, in the To field, highlight the Recipient, click Properties, and verify that the Address Type=CallPilot.

Messages remain in the subscriber’s Outbox
On Microsoft Outlook, messages remain in the mail client outbox (not the CallPilot Message Store outbox). This problem can be caused by the migration of messages from one server to another while maintaining the same Outlook client.

Remove the Exchange server, then re-add it to the subscriber’s profile.
To fix the Outbox

1. On the subscriber’s computer, on the Tools menu click Services. The Services dialog box appears.
2. Select CallPilot Desktop Messaging.
3. Press the Ctrl + Shift keys, and click Properties. The CallPilot Outbox Fix dialog box appears.
4. Click the Fix outbox button.

The subscriber cannot send messages

The subscriber cannot send messages to fax, AMIS or digital networking subscribers.

1. Make sure that the subscriber is addressing the message correctly. Refer the subscriber to “Address Formats” in their online Help.
2. Ensure that the subscriber has the capability to send messages to fax, AMIS and digital networking subscribers. Security concerns can restrict subscribers from sending messages to these types of subscribers.
3. For fax addresses, ensure that you can dial the number the subscriber is specifying from the subscriber’s phone set. Set-based restrictions can prevent the call from completing.

The subscriber cannot send a CallPilot message

The subscriber cannot send a CallPilot message. When the subscriber clicks Send, an error message appears that says, “Error. Failed to send message.”

- Ask the subscriber to check that their mailbox is not full. If their mailbox is full, they cannot send messages until some messages are deleted.
- Ask the subscriber to check the format of the message address. If the FQDN after the at (@) symbol does not match the FQDN of the Business Communications Manager configured to this mailbox, the message is rejected.
Ask the subscriber to verify that no attachment is empty. An empty attachment causes the entire message to be rejected. Delete the empty attachment and try sending the message again.

Verify that you can ping the Business Communications Manager:

1. At the DOS prompt, type:
   `ping <Business Communications Manager FQDN>`

2. If the response is “request timed out,” then type:
   `ping <Business Communications Manager IP address>`

   **Note:** If there is a reply, then the Business Communications Manager FQDN has not been properly configured to your Domain Name System (DNS). Contact your DNS administrator for assistance.

3. If there is no reply, verify that the Business Communications Manager can be reached on your LAN. Contact your IS administrator for help.

4. Verify that the Business Communications Manager is up and running.

**Non-delivery notification**

The subscriber receives non-delivery notifications for messages.

1. Ask the subscriber to verify that they have a valid attachment type.

2. Ask the subscriber to make sure that their mailbox is not full.

3. Ask the subscriber to make sure that they are addressing the message correctly. See “Address Formats” in the online Help.

4. Ask the subscriber to ensure that they are attaching only TIFF-F, VBK, WAV, or TXT files to their messages. Unified Messaging does not accept any other file types.

5. If the subscriber is sending to a remote location, ask the subscriber to verify that the address is valid and still exists.

6. For fax machines, ensure that the fax number is valid and the machine is accepting faxes.

7. Ensure that the subscriber has the capability to dial the number. Refer to the *CallPilot Manager Set Up and Operation Guide*.

8. Verify that the remote server is responding by issuing a network command on the Business Communications Manager. Internet Mail clients cannot send or receive WAV files.

**“Unknown” appears in the Sender field**

In some messages, the subscriber sees a name or phone number in the Sender field. In other messages, the subscriber sees “Unknown.”

If the caller’s phone system has Calling Line ID, CLID information appears in the Sender field for messages that are created when people phone you and you are not available. If CLID information is not provided, it appears as “Unknown.” For messages that are sent by people using Networking, if the sender’s name is not provided to the CallPilot system, the Sender field appears as “Unknown.”
The subscriber has problems with faxing

- If the error message states that the message cannot be sent because part of the media cannot be converted, or because the media is not supported at the recipient’s system, ensure that the subscriber only sends attachments that are TIFF-F, WAV, VBK, or text files.
- Ensure that the subscriber and the recipients can send and receive fax (TIFF-F) messages. Also, ensure that all TIFF files are TIFF-F files created using the Nortel Fax Printer. Not all TIFF files are class F.
- Ask the subscriber to check that their mailbox is not full. If, when they log on to Unified Messaging or the telephone, they receive a message that their mailbox is full, they cannot send any messages until they delete some messages to create space in their mailbox.

The subscriber has problems with fax reception

People do not receive faxes sent by the subscriber, or the subscriber does not receive faxes sent to them.

- Verify that the subscriber has a mailbox Class of Service with fax capability.
- Make sure that the people the subscriber is sending faxes to can receive faxes. For more information, refer to the Unified Messaging Quick Reference Guide.

The subscriber has problems receiving replies

People receive the subscriber’s CallPilot messages, but the subscriber does not receive their replies.

1. On the Actions menu, select CallPilot Configuration.
2. Click Properties.
3. Ensure that the SMTP/VPIM prefix is specified correctly.

Deleted messages remain in the subscriber’s mailbox

When a subscriber deletes messages using Unified Messaging, the messages are still in the subscriber’s mailbox when they access the mailbox using the telephone.

If the deleted messages are still in a Deleted Items folder in the CallPilot Message Store, the messages remain in the subscriber’s CallPilot mailbox. To remove the messages from both mailboxes, the subscriber must permanently delete them from the Deleted Items folder.

The subscriber cannot delete messages

When the subscriber tries to delete the messages permanently, the messages remain.

Subscribers cannot delete messages using Unified Messaging while they are logged on to their mailbox from their telephone.

Ask the subscriber to end the telephone mailbox session and then try to delete the messages from Unified Messaging.
Messages no longer on server

The subscriber receives the error message: “This message could not be found on the server. Messages must exist on the server in order to be played via the telephone. Use computer to play this file. Port failed.”

Voice messages that are saved to the subscriber’s computer are no longer in the CallPilot Inbox. The subscriber cannot play these messages from the telephone. To listen to these messages, the subscriber must use computer speakers or headphones.

Voice message does not play on telephone

The subscriber tries to play a voice message from the telephone. The subscriber answers the telephone when it rings but the message does not play.

1 Ask the subscriber to say something like “hello,” to initiate message playback.

2 Ask the subscriber to check the CallPilot player Status bar. If it states Open Pending, the subscriber should hang up the telephone. Then click Computer on the player, and click telset playback. The phone rings again.

3 Tell the subscriber that if the Status bar still says Open Pending, hang up again, wait three to five minutes, then try to play the message again. If this problem persists, contact your Nortel Customer Technical Support.

4 The number of outcalling channels used by the CallPilot telset player is determined by the number of outcalling channels configured in CallPilot Manager. Ensure that this number is greater than zero and that the other channels are not currently in use. For information about configuring outcalling channels, refer to the CallPilot Manager Set Up and Operation Guide.
The Message Waiting Indicator is active but there is no new message
The subscriber’s telephone Message Waiting Indicator is activated but there is no new message in the subscriber’s Desktop Inbox. This discrepancy can occur because messages are downloaded from the Business Communications Manager with the same frequency as e-mail messages (this applies only to Lotus Notes subscribers).

1. To adjust the frequency, on the File menu, select Tools.
2. Click User Preferences and click Mail.
3. Change the Check for mail every __ minutes setting.
4. If you want to check for mail immediately, on the Actions menu, select Refresh CallPilot Message List.

A reply to a message sent from Eudora is rejected on an AMIS network
A reply to a message cannot be sent over an AMIS network. The message is rejected because autotext is placed at the start of the message.

1. Open the Eudora.ini file using a text editor, such as Notepad.
2. Under the [Settings] statement, add these lines:
   - ReplyAllAttribution=
   - ReplyAttribution=
3. On the File menu, click Save to save the settings.

Unified Messaging does not work properly for subscribers who use ICQ Express with Outlook
Unified Messaging is incompatible with the ICQ Express add-on for Microsoft Outlook. Advise the subscriber to remove the ICQ Express add-on. Removing this add-on does not affect the operability of ICQ, it only removes the ICQ content from Outlook.

To remove the ICQ Express add-on:
1. Start Microsoft Outlook.
2. On the Tools menu, select Options.
3. Click the Other tab and select Advanced Options.
4. Click the COM Add-Ins button.
5. Select ICQ Express and click the Remove button.
   Unified Messaging and ICQ will now both operate as expected.
In sent messages, digits or symbols appear instead of language-specific symbols

The only character sets that are supported are us-ascii and ISO-8859-1. The messaging client must be configured to use ISO-8859-1 character encoding, usually displayed as the option Western (ISO-8859-1) or Western European ISO in most e-mail applications. This does not restrict users in other countries from using text messaging; it only limits which character sets can be used to compose and send these messages.

Internet Mail client error messages

Unified Messaging Internet Mail clients display error codes when a problem occurs. Table 1 describes Unified Messaging error codes.

Table 1  Internet Mail client error messages

<table>
<thead>
<tr>
<th>Code</th>
<th>Error message</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Your message did not reach some or all of the intended recipients.</td>
</tr>
<tr>
<td>16</td>
<td>The message was not delivered because an undefined problem occurred.</td>
</tr>
<tr>
<td>17</td>
<td>There is a problem with the specified address. Please verify the address.</td>
</tr>
<tr>
<td>18</td>
<td>The external telephone number used in addressing the message could not be dialed. Please verify the telephone number.</td>

</table>
Replacing the mail database in Lotus Notes

Replace the Lotus Notes mail database only if:

- a subscriber wants CallPilot messages to be stored in the same Inbox as their Lotus Notes e-mail messages
- the subscriber’s database design has not been customized, and the subscriber does not intend to customize the database design in the future
- you are familiar with modifying the Lotus Notes database design

Caution: Risk of data loss

Replacing the database design removes any customization in the current database design. If the mail database is customized, update the database instead of replacing it.

You can replace the mail database from the subscriber’s workstation or from the Notes server.

To replace the database design from the user’s computer

1. Log on to Lotus Notes on the subscriber’s workstation.
3. Select the mail database icon.
   The Replace Database Design dialog box appears.
5. Click Template Server.
   The Template Server dialog box appears.
6. Select Local, and then click OK.
7. Check the Show advanced templates box.
8. From the list, select CallPilot Mail (R5.0) or (6.0), depending on the version of Lotus Notes.
9. Make sure that:
   - Inherit future design changes is selected
   - Hide formulas and LotusScript is NOT selected
10. Click Replace.
    A message appears that asks you to confirm that you want to change the database’s view.
11. Click Yes.

To replace the database design (Notes server)

1. Install Unified Messaging on the Lotus Notes server computer.
2. Start Lotus Notes.
3. Choose File > Database > Open.
4 Select the mail database icon.

5 Choose File > Database > Replace design.
   The Replace Database Design dialog box appears.

6 Select the Show advanced templates check box.

7 Select CallPilot Mail (R4.5), CallPilot Mail (R4.6), or CallPilot Mail (R5.0), as required.

8 Make sure that:
   - Inherit future design changes is selected
   - Hide formulas and LotusScript is NOT selected

9 Click Replace.
   Repeat steps 3 through 9 for each database that you must update.

10 Press F9 to refresh the window and display the names.
Accessing Unified Messaging online Help

Unified Messaging for Microsoft Outlook, Novell GroupWise, and Lotus Notes provides standard Help.

**Note:** To access Internet Mail client Help, on the Messaging Administration menu click Internet Mail Client Administration.

Internet Mail client Help contains Help for the CallPilot interface. Use the manufacturer’s online Help for questions about your Internet Mail client.

To access online Help

From Microsoft Outlook:
- From your Inbox, on the Help menu, select CallPilot Desktop Messaging Help.

From Novell GroupWise:
- From your Inbox, on the Help menu, select CallPilot Desktop Messaging Help.

From Lotus Notes:
- From your Inbox, on the Actions menu, select CallPilot Help Topics.
Using Unified Messaging Support Tools

Resetting the CallPilot message store for Microsoft Outlook

This feature is available only for subscribers who use Microsoft Outlook. Resetting the CallPilot message store removes invalid or corrupt messages from the inbox.

Lotus Notes and GroupWise clients can reset their mailboxes by choosing the Refresh CallPilot Message List option.

To reset CallPilot message store for Microsoft Outlook 2000

1. Press Ctrl + Shift.
2. On the Tools menu, click Send and Receive, and then click CallPilot Transport.
3. Press Ctrl + Shift until the CallPilot Reset Mailbox dialog box appears.
4. Select the Reset Mailbox button.

All CallPilot messages are purged from the subscriber's mailbox, and the CallPilot message headers that are stored for the subscriber are downloaded again. The messages disappear and then reappear one by one. All message caching is lost.

Note: The messages are not deleted from CallPilot. The messages are removed from the client computer cache. The messages are downloaded again from Business Communications Manager to the client computer.

This feature is intended for system administrators and CallPilot product support.
CPTrace

You can use CPTrace to collect information about problems with any of the desktop clients that run CallPilot. You save this information to a log file that you can analyze to determine the cause of the problem.

Problems you can look for include:

- trouble connecting to the Business Communications Manager system
- CallPilot player problems
- address book problems
- problems with message compose, reply, forward, delete and notification

To use CPTrace, you must understand Unified Messaging functionality and the corresponding components on the IMAP server.

**Note:** Running CPTrace affects how CallPilot works. It is possible that you will not be able to reproduce problems while CPTrace is running.

CPTrace.exe is installed with each desktop client in the `\Program Files\Nortel\<client directory>`:

- for Microsoft Outlook, in nmdc
- for Lotus Notes, in nmin
- for GroupWise, in nmgw

**Using CPTrace**

To use CPTrace, double-click the CPTrace.exe in the corresponding desktop client directory.
**CPTrace settings**

The CPTrace settings are stored in the Windows registry. The existing settings are used each time you run CPTrace.

<table>
<thead>
<tr>
<th>CPTrace Settings</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMAP/SMTP</td>
<td>Logs all IMAP/SMTP traffic</td>
</tr>
<tr>
<td>Desktop client</td>
<td>Logs internal Outlook, Lotus Notes and GroupWise traffic</td>
</tr>
<tr>
<td>Audio Player</td>
<td>Logs Audio player traffic</td>
</tr>
<tr>
<td><strong>File</strong></td>
<td>File writes logs to a file. Check this box and type a file name and extension to maintain the log. You can include a directory path such as c:\my player. When you close CPTrace with the File check box selected, the Desktop client continues to write information to the file selected. This slows down the Desktop operation slightly. The log file never gets larger than 1MB. When the file size reaches 1MB, 10 percent of the file is purged, starting with the oldest data. If you select the File check box and close CPTrace, you receive a warning that File tracing is still enabled and you are asked whether you want to leave file tracing on. Click Yes to leave file tracing enabled.</td>
</tr>
<tr>
<td>Window</td>
<td>Window writes logs to the display window.</td>
</tr>
<tr>
<td>Erase</td>
<td>Erase deletes the log file from the directory you defined for it. A message appears that asks you to confirm the deletion.</td>
